

# Multiplexing on SSRC ID

---

- Should we change “RTP session” to be:  
<destination network address,  
destination port pair for RTP and RTCP,  
SSRC ID (associated with source, not dest)>
- Restated: Why disallow multiplexing of  
RTP sessions based on SSRC ID  
(RTP spec lists several reasons)

# Multiplexing on SSRC ID (2)

---

- Definition change would conflict with endpoint generating multiple sources in one session (two video cameras)
- Assignment of SSRC ID would need to be coordinated among sources
- Question prompted by poor OS performance with many ports -- why not fix the OS instead?
