

draft-bagnulo-behave- dns64 update

M. Bagnulo, P. Matthews, I. van
Beijnum, A. Sullivan, M. Endo

Application scenario

(from BEHAVE slides at <http://www3.ietf.org/proceedings/09mar/slides/behave-8.pdf>)

Comment still needed

- In case where $DO=1$ and $CD=0$, what should validating recursive translating resolver do?
 - Remove A record and any DNSSEC data from answer
 - Add synthesized AAAA record in answer
 - Set AD bit on response
 - not what -02 draft says (new feedback)

Confirming feedback

- Planning to move A record out of answer and into additional section
 - Just a debugging hint
 - **MUST NOT** rely on it
 - Can't be used for validation

Next steps

- Now WG item
- Update document with less discussion, more specific protocol
- Includes more specifics about implementation (includes what caching servers **MUST** do)
- More DNS eyes would be a good thing (that's you!)
