NETCONF Monitoring Schema
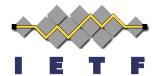

draft-ietf-netconf-monitoring-schema-**04**
IETF-74, Mar 2006, San Francisco

Björklund, Chisholm, Scott

I E T F

Updates in -04

- WGLC comments on v-03
    - detailed responses sent to mailing list
    - changes incorporated into v-04

- Some items raised requiring resolution in other drafts
    - Partial locking: lock-id must be unique per server, not per session
    - 4741bis: will dynamic capabilities be supported?   What behavior would be mandatory (notification support? would sessions be preserved across change?)

Items for discussion

- Open items remaining for discussion
  1. Current assumption is a schema only defines one namespace (based on fact a single namespace is returned per schema in the schema list). This is consistent with the hello message, but we may want monitoring to be extensible and define this as a leaf-list?

  2. Counter definitions: are the current counters sufficient? If not, should we kickoff a focused team to propose a new set? Or leave the existing counters and defer more detailed counter definitions to another draft?

  3. Extensibility: Should we replace the enums in the XSD model with QNames? (similar to use of identities in YANG)

I E T F

Next Steps

- Close open items on mailing list

- Taking Comments on -04
  - Please keep sending comments

- Update v-05 accordingly

  - target early April for publication of -05
