Abstract

This document contains the specification for the Deterministic Networking YANG Model for configuration and operational data for DetNet Flows. The model allows for provisioning of end-to-end DetNet service on devices along the path without dependency on any signaling protocol. It also specifies operational status for flows. An operator or network controller programs the configuration of the devices.

The YANG module defined in this document conforms to the Network Management Datastore Architecture (NMDA).

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 25 April 2022.

1. Introduction

DetNet (Deterministic Networking) provides a capability to carry specified unicast or multicast data flows for real-time applications with extremely low packet loss rates and assured maximum end-to-end delivery latency. A description of the general background and concepts of DetNet can be found in [RFC8655].

This document defines a YANG model for DetNet based on YANG data types and modeling language defined in [RFC6991] and [RFC7950]. DetNet service, which is designed for describing the characteristics of services being provided for application flows over a network, and DetNet configuration, which is designed for DetNet flow path establishment, flow status reporting, and DetNet functions configuration in order to achieve end-to-end bounded latency and zero congestion loss, are both included in this document.

2. Abbreviations

The following abbreviations are used in this document:

- PEF: Packet Elimination Function
- PRF: Packet Replication Function
- PEOF: Packet Elimination and Ordering Functions
- PERF: Packet Elimination and Replication Functions
- PREOF: Packet Replication, Elimination and Ordering Functions
- MPLS: Multiprotocol Label Switching

3. Terminology

This document uses the terminology defined in [RFC8655].

4. DetNet YANG Module

The DetNet YANG module includes DetNet App-flow, DetNet Service Sub-layer, and DetNet Forwarding Sub-layer configuration and operational objects. The corresponding attributes used in different sub-layers are defined in Section 3.1, 3.2, 3.3 respectively.

Authors' Addresses
Layers of the objects typically occur in the different data instances forming the node types defined in [RFC8655]. Figure 1 illustrates the relationship between data instance node types and the included layers. Node types typically are logical per DetNet service and one DetNet service can be one node type while another is another node type on same device. This model is a controller based model because a controller or operator configures all the devices to form a service.

![Figure 1: DetNet Layers and Node Types](image)

All of the layers have ingress/incoming and egress/outgoing operations but any instance may be configured as only unidirectional. This means that each unidirectional flow identifier configuration is programmed starting at the ingress and flow status is reported at ingress on each end. In the MPLS cases once encapsulated, the IP six tuple parameters may not be required to be programmed again. In the IP case, without encapsulation, various IP flow id parameters must be configured along the flow path.

In the YANG model the terms source and destination are used as flow identifiers whereas ingress and egress refer to a DetNet application direction from the application edge. Ingress is to the DetNet application and egress is from the application. The terms incoming and outgoing generally represent the flow direction towards the remote application. Outgoing is viewed as going up the stack from Application sub-layer to Forwarding sub-layer and incoming is the reverse. Although, in examples where there is aggregation and disaggregation outgoing relates to the aggregating output and incoming relates to the disaggregating flows.

At the egress the YANG model is handing off IP or MPLS to a next hop and a routing next hop structure is used.

### 4.1. DetNet Application Flow YANG Attributes

DetNet application flow is responsible for mapping between application flows and DetNet flows at the edge node(egress/ingress node). The application flows can be either layer 2 or layer 3 flows. To map a flow at the User Network Interface (UNI), the corresponding attributes are defined in [RFC9016].
4.2. **DetNet Service Sub-layer YANG Attributes**

DetNet service functions, e.g., DetNet tunnel initialization/termination and service protection, are provided in the DetNet service sub-layer. To support these functions, the following service attributes need to be configured:

- DetNet flow identification
- Service function indication, indicates which service function will be invoked at a DetNet edge, relay node or end station. (DetNet tunnel initialization or termination are default functions in DetNet service layer, so there is no need for explicit indication). The corresponding arguments for service functions also needs to be defined.

4.3. **DetNet Forwarding Sub-layer YANG Attributes**

As defined in [RFC8655], DetNet forwarding sub-layer optionally provides congestion protection for DetNet flows over paths provided by the underlying network. Explicit route is another mechanism that is used by DetNet to avoid temporary interruptions caused by the convergence of routing or bridging protocols, and it is also implemented at the DetNet forwarding sub-layer.

To support congestion protection and explicit route, the following transport layer related attributes are necessary:

- Flow Specification and Traffic Requirements, refers to [RFC9016]. These may used for resource reservation, flow shaping, filtering and policing by a control plane or other network management and control mechanisms.
- Since this model programs the data plane existing explicit route mechanisms can be reused. If a static MPLS tunnel is used as the transport tunnel, the configuration need to be at every transit node along the path. For an IP based path, the static configuration is similar to the static MPLS case. This document provides data-plane configuration of IP addresses or MPLS labels but it does not provide control plane mapping or other aspects.

5. **DetNet Flow Aggregation**

DetNet provides the capability of flow aggregation to improve scalability of DetNet data, management and control planes. Aggregated flows can be viewed by the some DetNet nodes as individual DetNet flows. When aggregating DetNet flows, the flows should be compatible: if bandwidth reservations are used, the reservation should be a reasonable representation of the individual reservations; if maximum delay bounds are used, the system should ensure that the aggregate does not exceed the delay bounds of the individual flows.

The DetNet YANG model defined in this document supports DetNet flow aggregation with the following functions:

- Aggregation flow encapsulation/decapsulation/identification
- Mapping individual DetNet flows to an aggregated flow
• Changing traffic specification parameters for aggregated flow

The following cases of DetNet aggregation are supported:

• Ingress node aggregates App flows into a service sub-layer of DetNet flow
• In ingress node, the service sub-layers of DetNet flows are aggregated into a forwarding sub-layer
• In ingress node, the service sub-layers of DetNet flows are aggregated into a service sub-layer of an aggregated DetNet flow
• Relay node aggregates the forwarding sub-layers DetNet flows into a forwarding sub-layer
• Relay node aggregates the service sub-layers of DetNet flows into a forwarding sub-layer
• Relay node aggregates the service sub-layers of DetNet flows into a service sub-layer of Aggregated DetNet flow
• Relay node aggregates the forwarding sub-layers of DetNet flow into a service sub-layer of Aggregated DetNet flow
• Transit node aggregates the forwarding sub-layers of DetNet flows into a forwarding sub-layer

Traffic requirements and traffic specification may be tracked for individual or aggregate flows but reserving resources and tracking the services in the aggregated flow is out of scope.

6. DetNet YANG Structure Considerations

The picture shows that the general structure of the DetNet YANG Model:

There are three layer types in DetNet YANG Model: App-flow data layer, service sub-layer and forwarding sub-layer. Additionally, the Traffic parameters are captured in a Traffic profile that can be referenced by any of the layers.

Below is a a summary YANG tree showing the major items. A complete YANG tree is in section Appendix A.
A traffic profile can be created for application, service sub-layer or forwarding sub-layer. A single profile may be shared by multiple applications/sub-layer. Each profile indicates the members that currently are using a profile.

Depending on which DetNet layers and functions are required, some or all of the components may configured. Examples are shown in Appendix B.

## 7. DetNet Configuration YANG Structures

The following is a partial tree representation of the YANG as defined in [RFC8340]. This corresponds to the structure layout in the previous section.

```yangle
module: ietf-detnet
  +--rw detnet

9. IANA Considerations

This document registers a URI in the "IETF XML Registry" [RFC3688]. Following the format in [RFC3688], the following registration is requested to be made:

ID:   yang:ietf-detnet
Registrant Contact:  The IESG.
XML:  N/A, the requested URI is an XML namespace.

This document registers YANG modules in the "YANG Module Names" registry [RFC6020].
10. Security Considerations

The YANG modules specified in this document define a schema for data that is designed to be accessed via network management protocols, such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The Network Configuration Access Control Model (NACM) [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.

There are a number of data nodes defined in the modules that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can break or incorrectly connect DetNet flows.

Appendix B. Examples

The following examples are provided. These examples are tested with Yanglint and use operational output to exercise both config true and config false objects. Note that IPv4 and IPv6 addresses are supported but for clarity in the examples and diagrams IPv4 has been used in most examples. The IP types are imported from [RFC6991] and these support both IPv4 and IPv6.

The following are examples of aggregation and disaggregation at various points in Detnet. Figures are provided in the PDF version of this document.

B.1. Example A-1 JSON Configuration/Operational

This illustrates simple aggregation. Ingress node 1 aggregates App flows 0 and 1 into a service sub-layer of DetNet flow 1. Two ways of illustrating this follow, then the JSON operational data model corresponding to the diagrams follows. This example uses IPv6 address format.
Figure 2: Case A-1 Example JSON Operational/Configuration

Figure 3: Case A-1 Example JSON Operational/Configuration

B.4. Example C-1 JSON Relay Aggregation/Disaggregation Configuration

This illustrates the Relay node 1 aggregating the forwarding sub-layers of DetNet flows 1 and 2 into a forwarding sub-layer. A diagram illustrating both aggregation and disaggregation is shown and then the corresponding JSON operational data follows.

```
{
    "name": "eth2",
    "type": "iana-if-type:ethernetCsmacd",
    "oper-status": "up",
    "statistics": {
        "discontinuity-time": "2020-10-02T19:59:00-04:00"
    }
},
{
    "name": "eth3",
    "type": "iana-if-type:ethernetCsmacd",
    "oper-status": "up",
    "statistics": {
        "discontinuity-time": "2020-10-02T19:59:00-04:00"
    }
},
{
    "name": "eth4",
    "type": "iana-if-type:ethernetCsmacd",
    "oper-status": "up",
    "statistics": {
        "discontinuity-time": "2020-10-02T19:59:00-04:00"
    }
}
```

B.5. Example C-2 JSON Relay Aggregation Service Sub-Layer

This illustrates the Relay node 1 aggregating the service sub-layers of DetNet flows 1 and 2 into a forwarding sub-layer A diagram illustrating both aggregation and disaggregation is shown and then the corresponding JSON operational data follows.

Figure 14: Example C-2 DetNet JSON Relay Disaggregation Service Sub-Layer
B.6. Example C-3 JSON Relay Service Sub-Layer Aggregation/Disaggregation

This illustrates the Relay node 1 aggregating the service sub-layers of DetNet flows 1 and 2 into a service sub-layer of Aggregated DetNet flow 1. It also illustrates the Relay node 2 disaggregating the aggregated DetNet flow 1 into the DetNet flows 1 and 2 service sub-layers. A diagram illustrating both aggregation and disaggregation is shown and then the corresponding JSON operational data follows.

Note: S and A labels in this diagram include d-CWs of their own.

B.7. Example C-4 JSON Relay Service Sub-Layer Aggregation/Disaggregation

This illustrates the Relay node 1 aggregating the forwarding sub-layers of DetNet flow 1 and 2 into a service sub-layer of Aggregated DetNet flow 1. This also illustrates the Relay node 2 disaggregating the service sub-layer of Aggregated DetNet flow 1 to forwarding sub-layers of DetNet flow 1 and 2. A diagram illustrating both aggregation and disaggregation is shown and then the corresponding JSON operational data follows.

B.8. Example D-1 JSON Transit Forwarding Sub-Layer Aggregation/Disaggregation

This illustrates the Transit node 1 aggregating the forwarding sub-layers of DetNet flow 1 and 2 into a forwarding sub-layer. This also illustrates a Transit node 4 disaggregating a forwarding sub-layer into DetNet flow 1 and 2 forwarding sub-layers.
Figure 21: Case D-1 Example Service Aggregation/Disaggregation
