Virtualization YANG Service Model (VYSM)
draft-shytyi-netmod-vysm-01.txt

Abstract

This document provides a specification of the Virtual Network Functions YANG Service Model (VYSM). The VNF YANG Service Model serves as a base framework for managing an universal Customer-Premises Equipment (uCPE) NFV subsystem from the Orchestrator.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 16, 2019.

1. Introduction

Network Function Virtualization is a technology that allows to virtualize the network services running on dedicated hardware. This technology became a base for universal Customer-Premises Equipment (uCPE). This document defines the uCPE as hardware with x86 capabilities (whitebox or greybox) that has a hypervisor. In other words, uCPE is a host that may run multiple Virtual Machines with guest OSs, where each Guest OS may represent a Physical Network Function. This document presents the VNF YANG Service Model (VYSM) to manage from an Orchestrator the Network Function Virtualization Infrastructure inside the uCPE.

2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

Link - is an entity that enables link layer communication of nodes.

Port - node connector to the link.

NE - Network Element.

NSYM - Network Service Yang Module.

VYSM - VNF YANG Service Model.
3. Universal CPE

Firstly, this document defines the platform that is controlled with VYSM - universal CPE (uCPE). The uCPE as hardware with x86 capabilities that is running Linux distribution with additinal virtualisation layer. Virtualization layer provides virtual compute, virtual storage and virtual network resources. Each VNF running in the uCPE requires the amount of virtual resources (for example: 4 vCPUs, 4GB RAM, 40GB storege, 4 vPorts). VNFs MAY be interconnected between each other and physical ports via Virtual Networks. The figure below presents the uCPE architecture.

<table>
<thead>
<tr>
<th>VNF1</th>
<th>VNF2</th>
<th>VNF3</th>
<th>uCPE software</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual Compute</td>
<td>Virtual Storage</td>
<td>Virtual Networks</td>
<td></td>
</tr>
<tr>
<td>PHY x86 processor</td>
<td>RAM+PHY storage</td>
<td>PHYysical ports</td>
<td>uCPE Hardware</td>
</tr>
</tbody>
</table>

4. Virtual Network Function YANG Service Model

Secondly, this document defines and classifies the VYSM as Network Service YANG Module (NSYM) layer component RFC 8199 [RFC8199]. Thus it inherits the characteristics of the NSYM Layer. VYSM is a modeled representation of the specific service requirements. It provides abstraction of services configuration and operations that MAY be implemented in Network Elements (NEs). Thus VYSM does not describe all configuration to be performed on the devices, but provides the configuration that is required for the "Network Service to Network Element(s)" decomposition process RFC 8199 [RFC8199]. Example of the decomposition is presented in the figure below.

The Network Service YANG module exposes the configuration commands via the Southbound interfaces of the orchestrator. Therefore the set of the commands modeled in the VYSM can be inputed via Southbound interfaces (for example CLI). In the example the command "vm VNF1" is passed via Southbound interface to the orchestrator. It defines the virtual machine name. Further the same configuration MAY be transormed to the one or multiple Network Element payloads (for example xml for NETCONF) that carry an equivalent of commands such as "nf nf-name VNF1"
5. VNF YANG Service Model tree diagram overview

This section provides an overview of the VNF Service YANG Model (VSYM) that MAY be made with "pyang" utility. The figure below presents the tree diagram of VYSM.
module: ietf-vysm
  +--rw virtualization* [name]
    +--rw name            string
    +--rw device*         string
