

# The RPKI Wayback Machine

(or: Ziggy says there's a 50% chance we'll end up in 2011)

Roland van Rijswijk-Deij

# What we wanted to do

- At NLnet Labs, **we make RPKI Relying Party software** called Routinator
- **Routinator** has seen a **lot of uptake in production (thank you!)**
- We want to **test our software** to ensure it is robust
- **Enter:**  
**8 years of RPKI ROA data for all the RIRs provided by RIPE NCC!**

**ROUTINATOR**

# How we processed the data

- **RIPE NCC archived all RPKI repositories** pretty much **since RPKI day zero**
- We got **dumps in .tar.gz files** with all RPKI objects, but no historic TALs
- So **we wrote a tool we called "Ziggy"** to transport us **back in RPKI time**

# Interlude: Ziggy!

- Remember Quantum Leap? I do :-)

# What does Ziggy do?

- You can **give Ziggy** (our Python script) **a date**, and it will then:
  - **Find and unpack all .tar.gz files** for that date, in a Routinator-friendly structure
  - **Recreate TALs** based on the trust anchors from the archives
  - **Run Routinator using "faketime"** for the specified date
- We did this from **January 2011 to February 2019**

# Quick recap: jargon

- Reminder (also if you read the slides later):
- **RPKI**      **R**esource **P**ublic **K**ey **I**nfrastructure
- **ROA**      **R**oute **O**origin **A**uthorisation  
(authorises a certain AS to announce certain prefixes)
- **VRP**      **V**erified **ROA** **P**ayload (yes, acronym in acronym...)  
(a cryptographically valid statement about a prefix from a ROA)

# Growth of VRPs over time

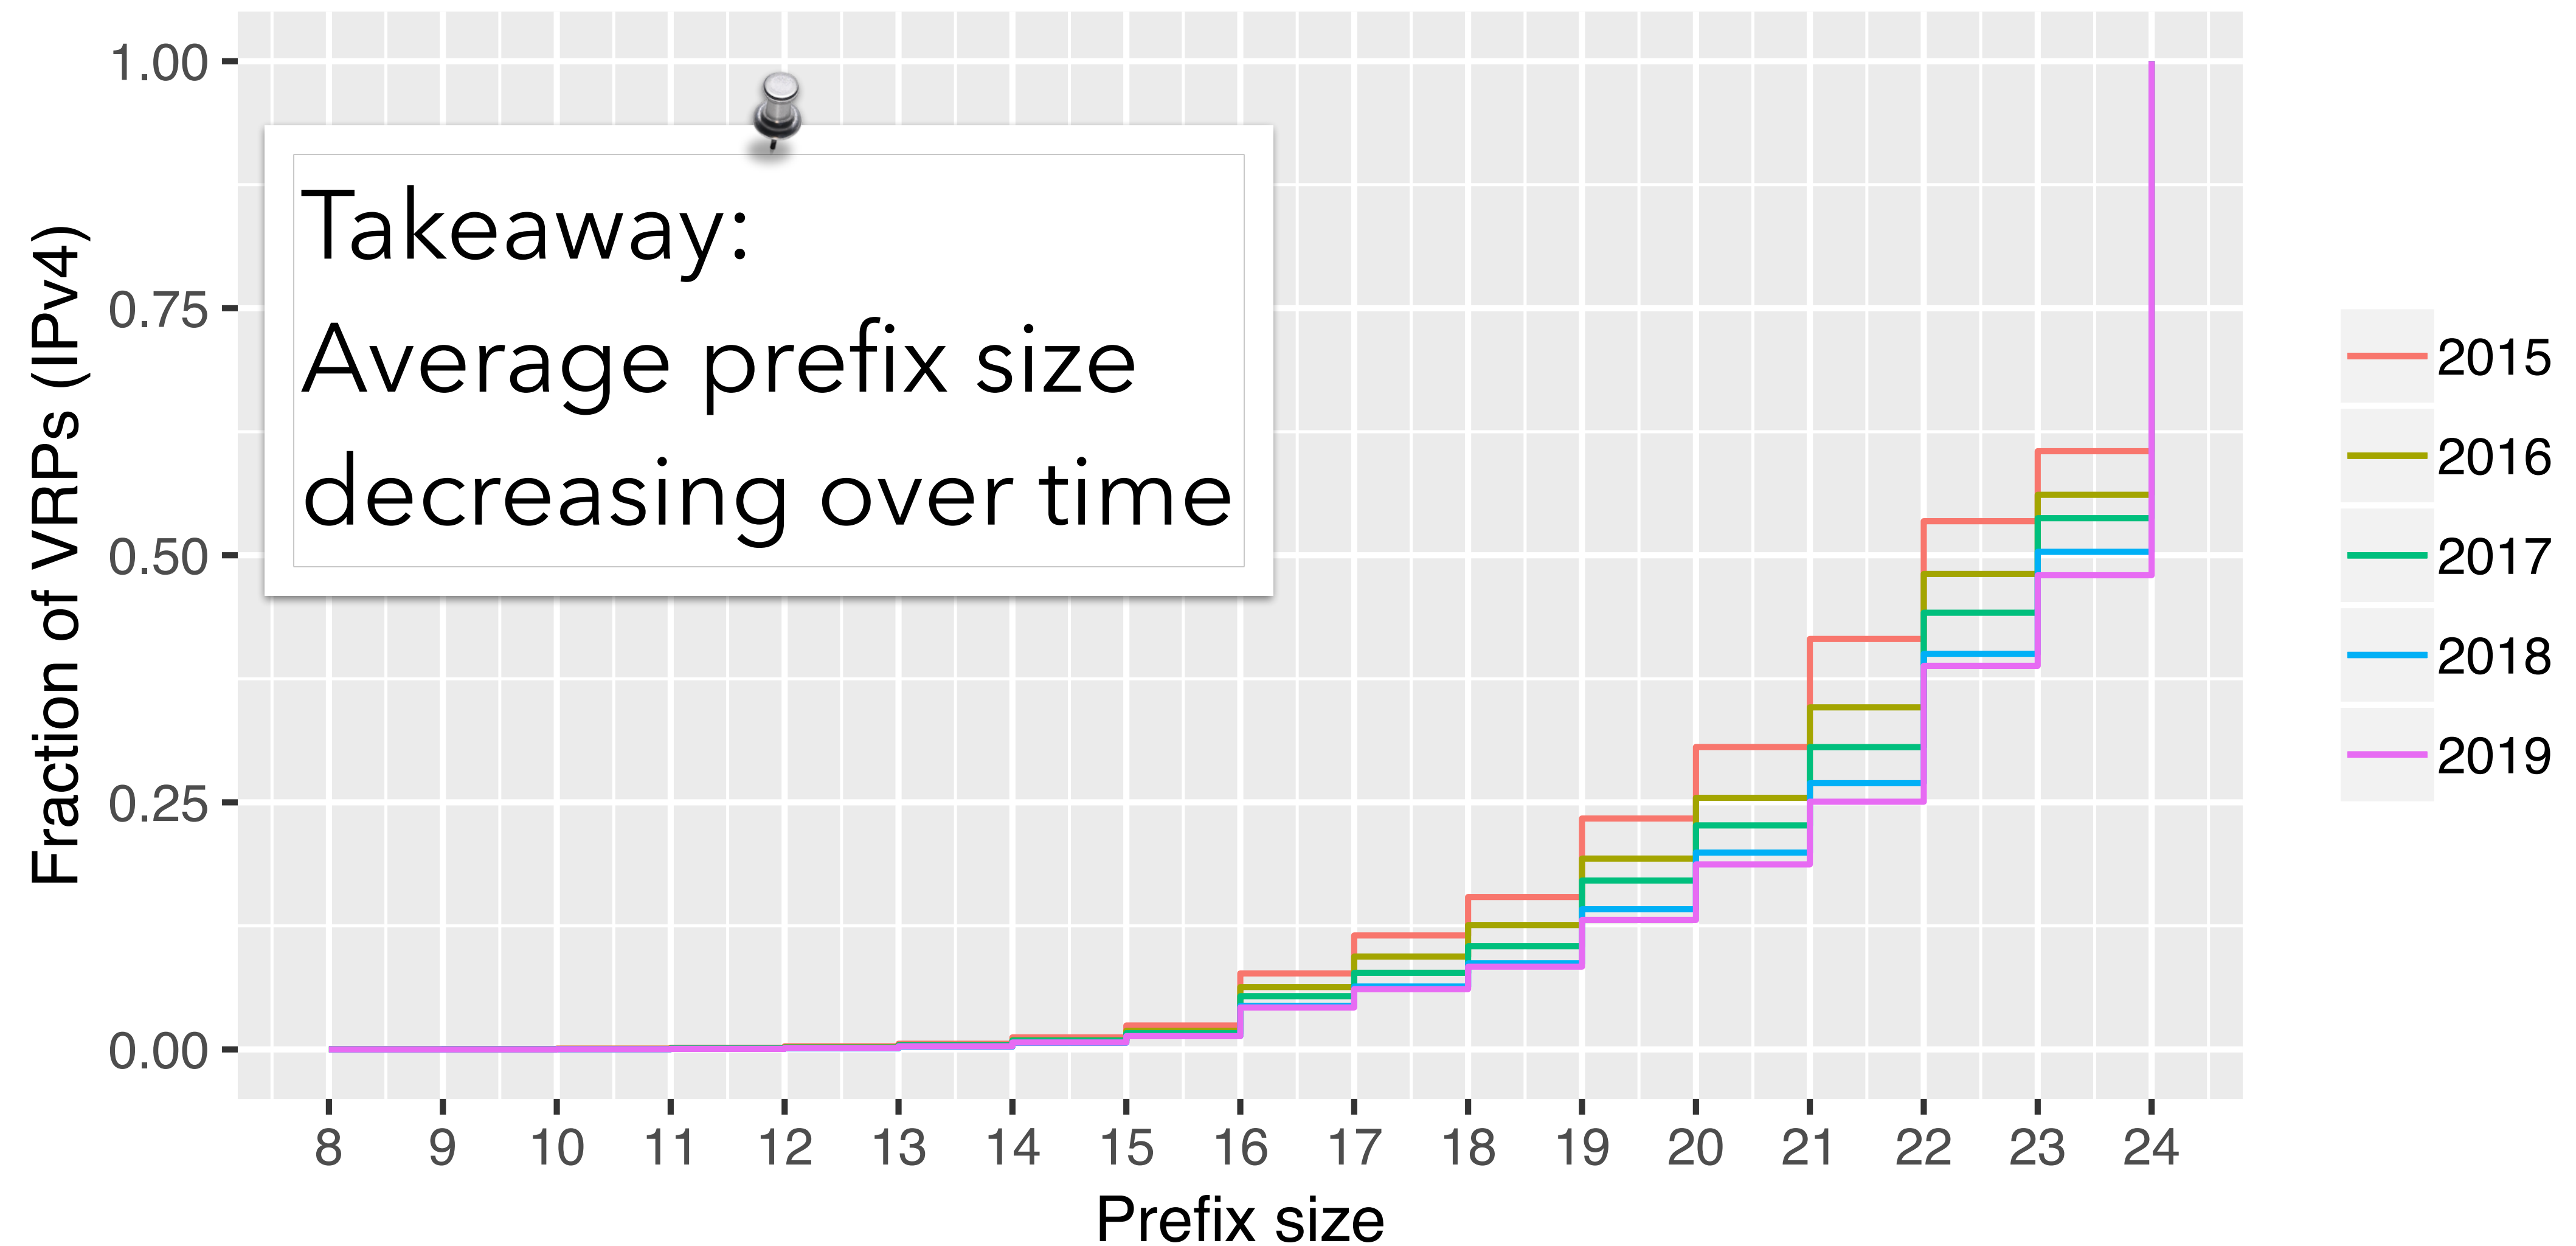

# Of course *\*also\** for IPv6 ;-)

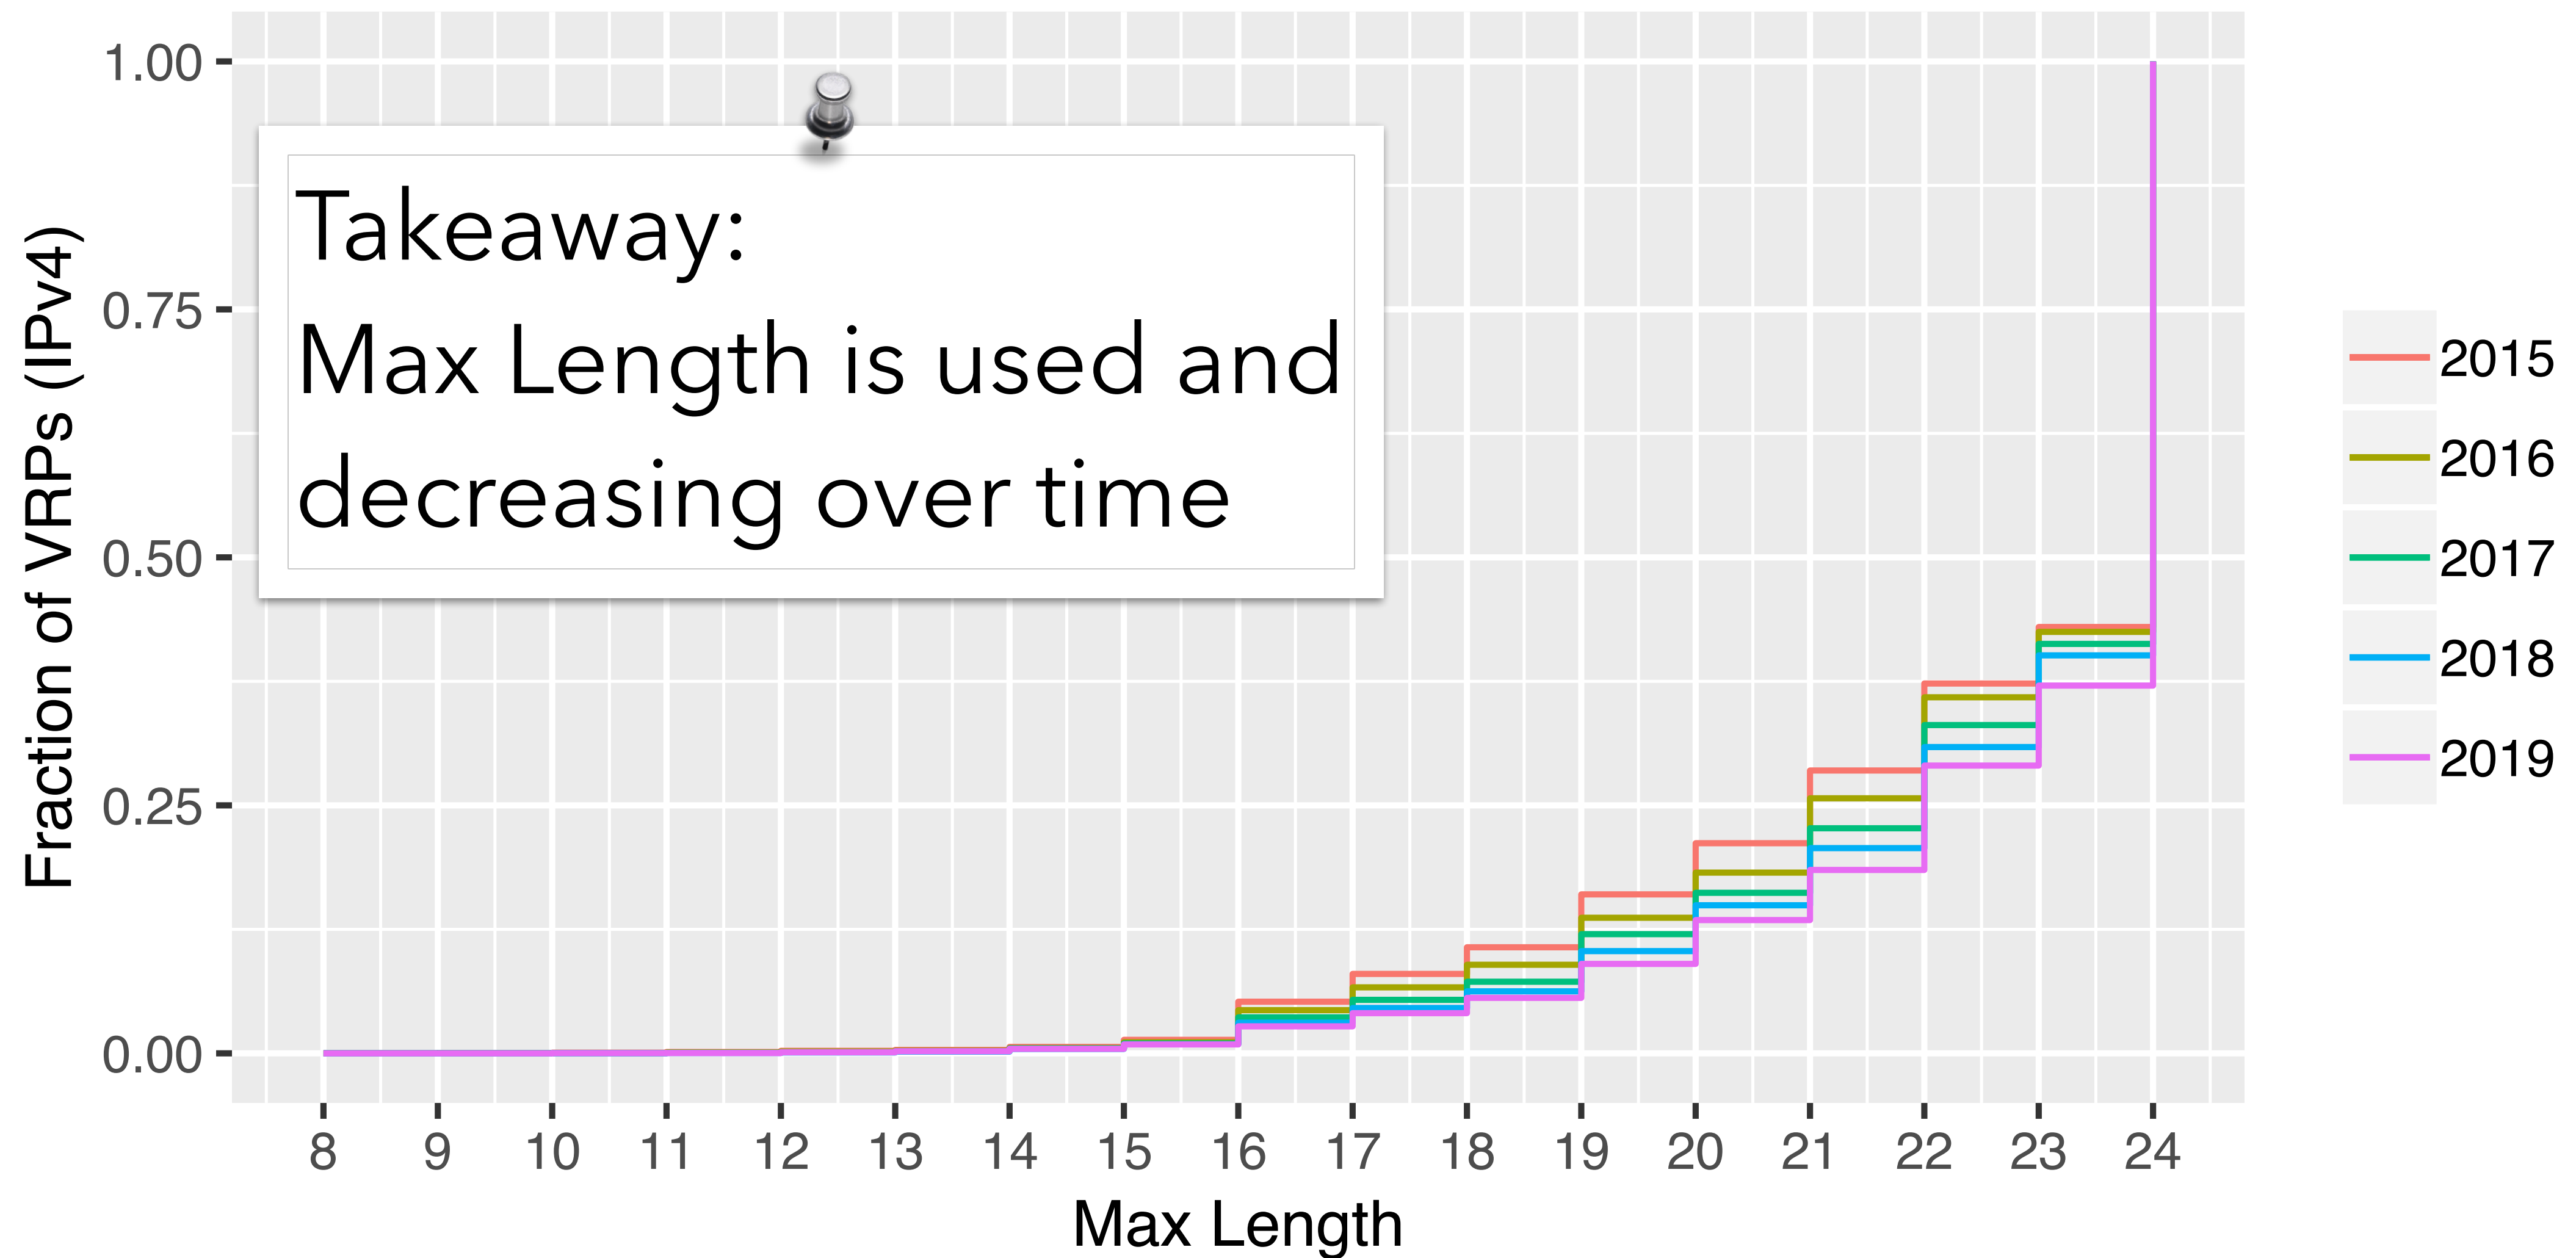

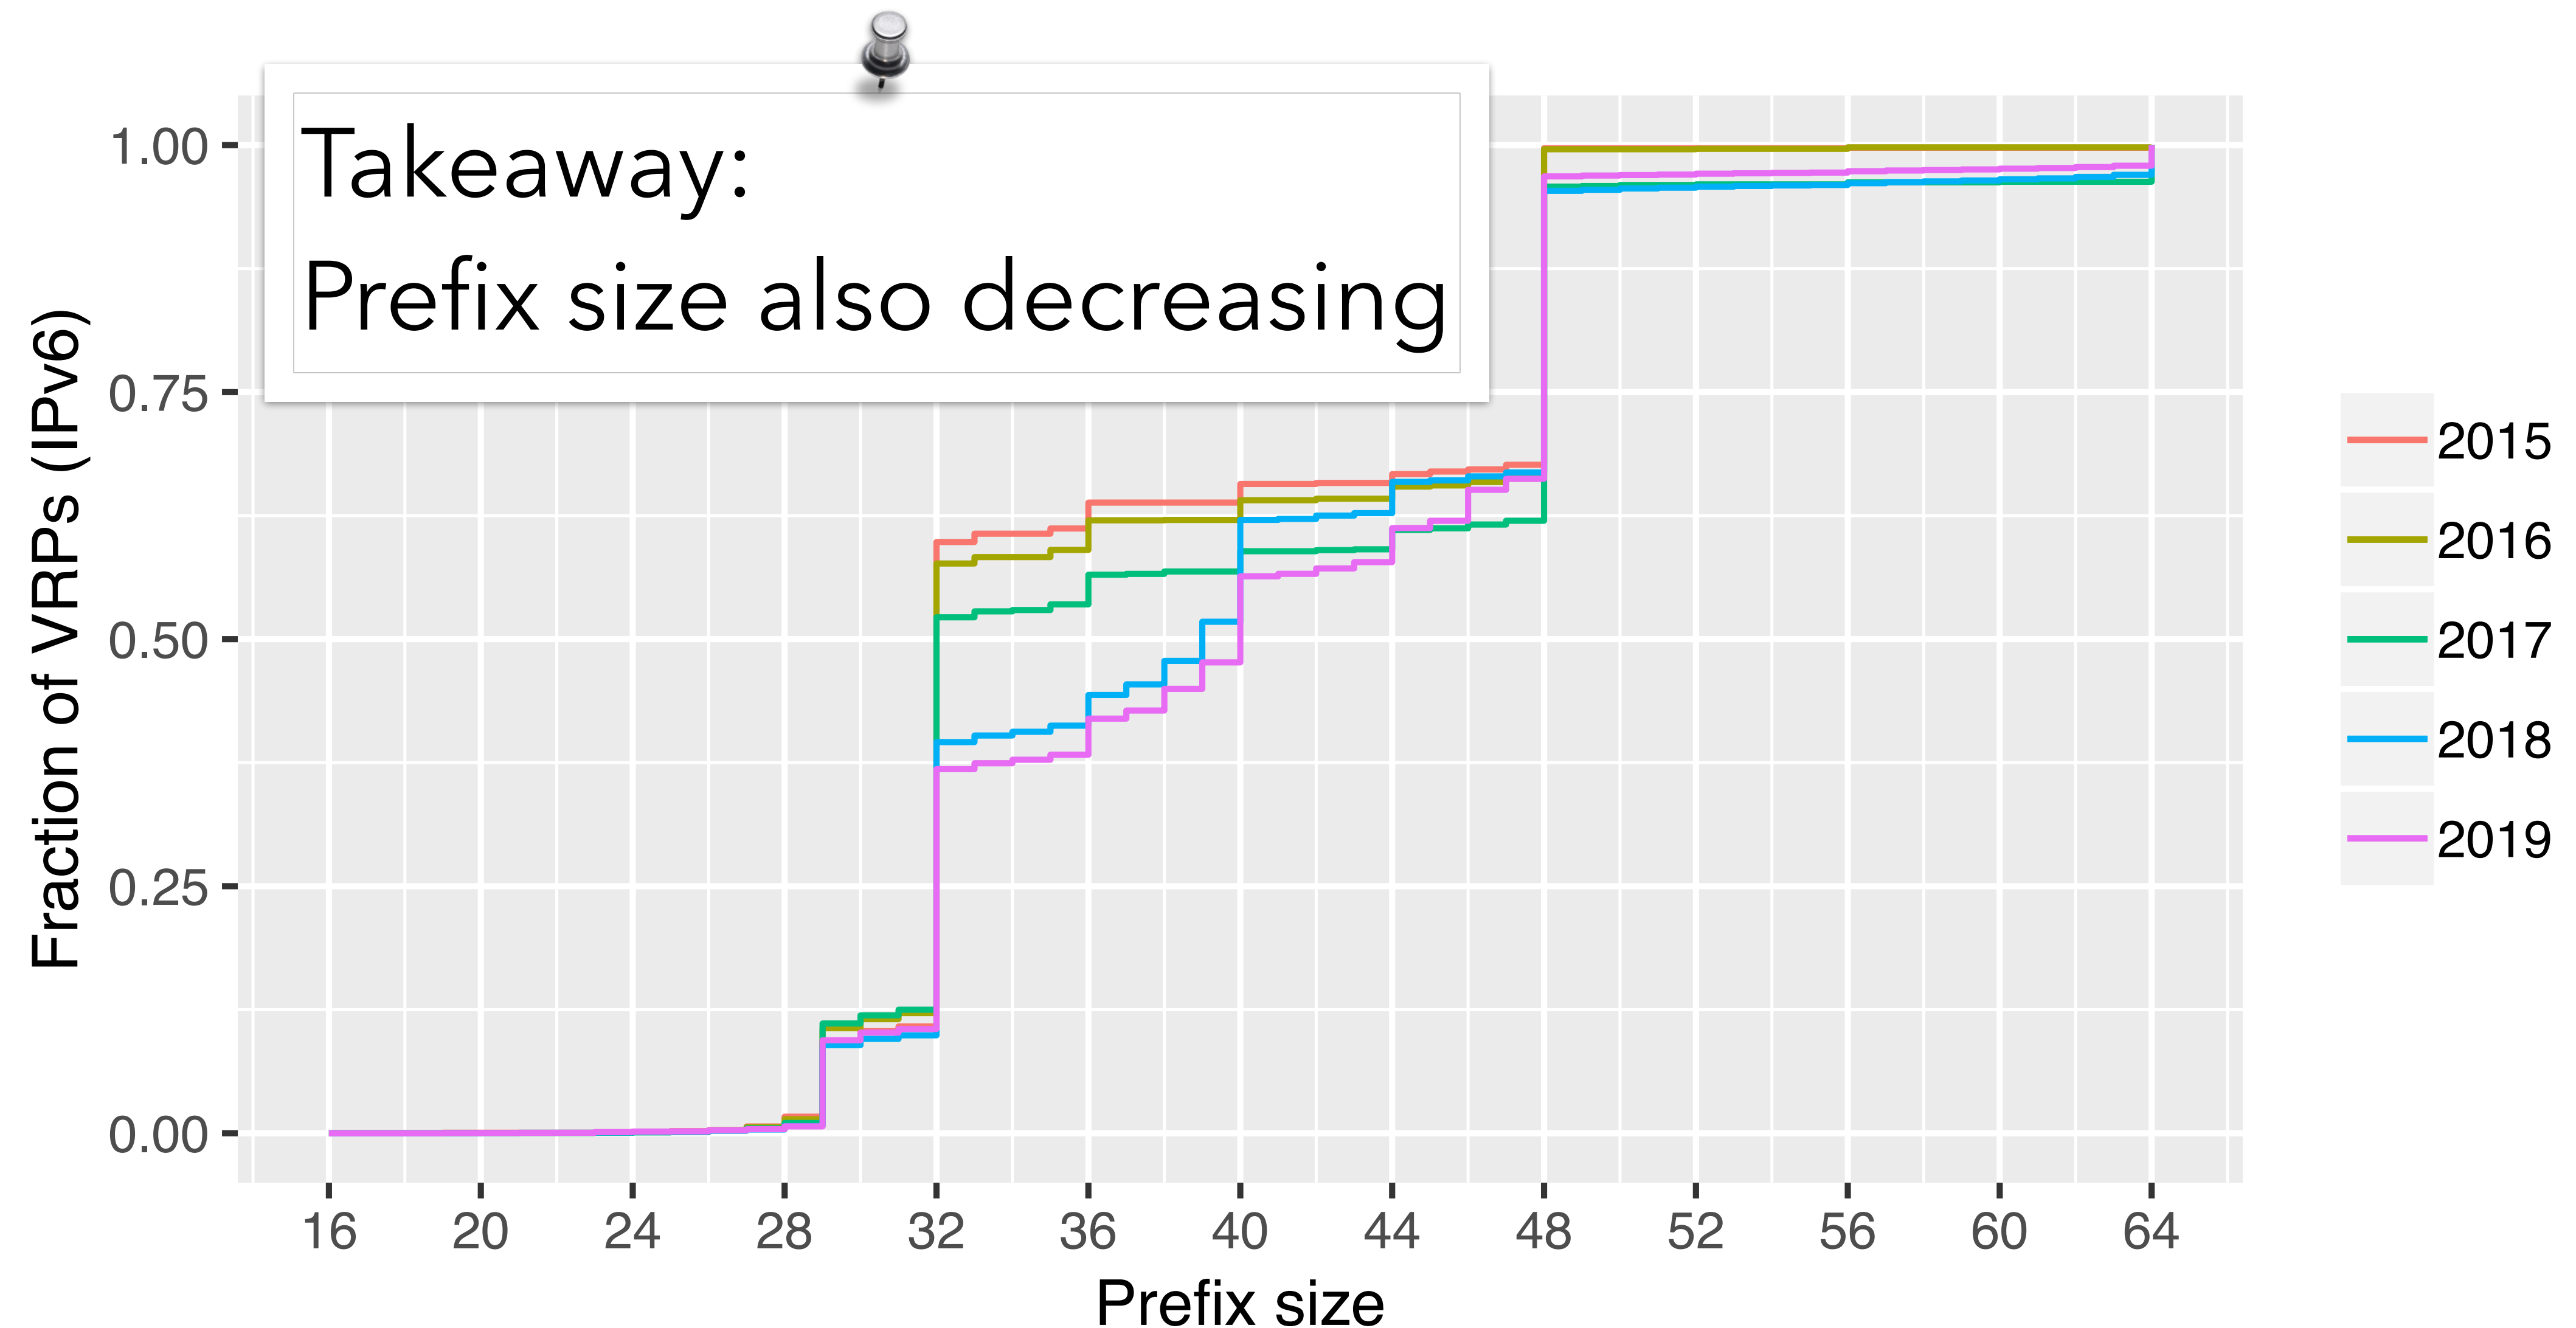

# Prefix size in VRPs over time (IPv4)

# Max Length in VRPs over time (IPv4)

# Prefix size in VRPs over time (IPv6)

# Max Length in VRPs over time (IPv6)

# Use of Max Length over time

# One more thing: average prefix size

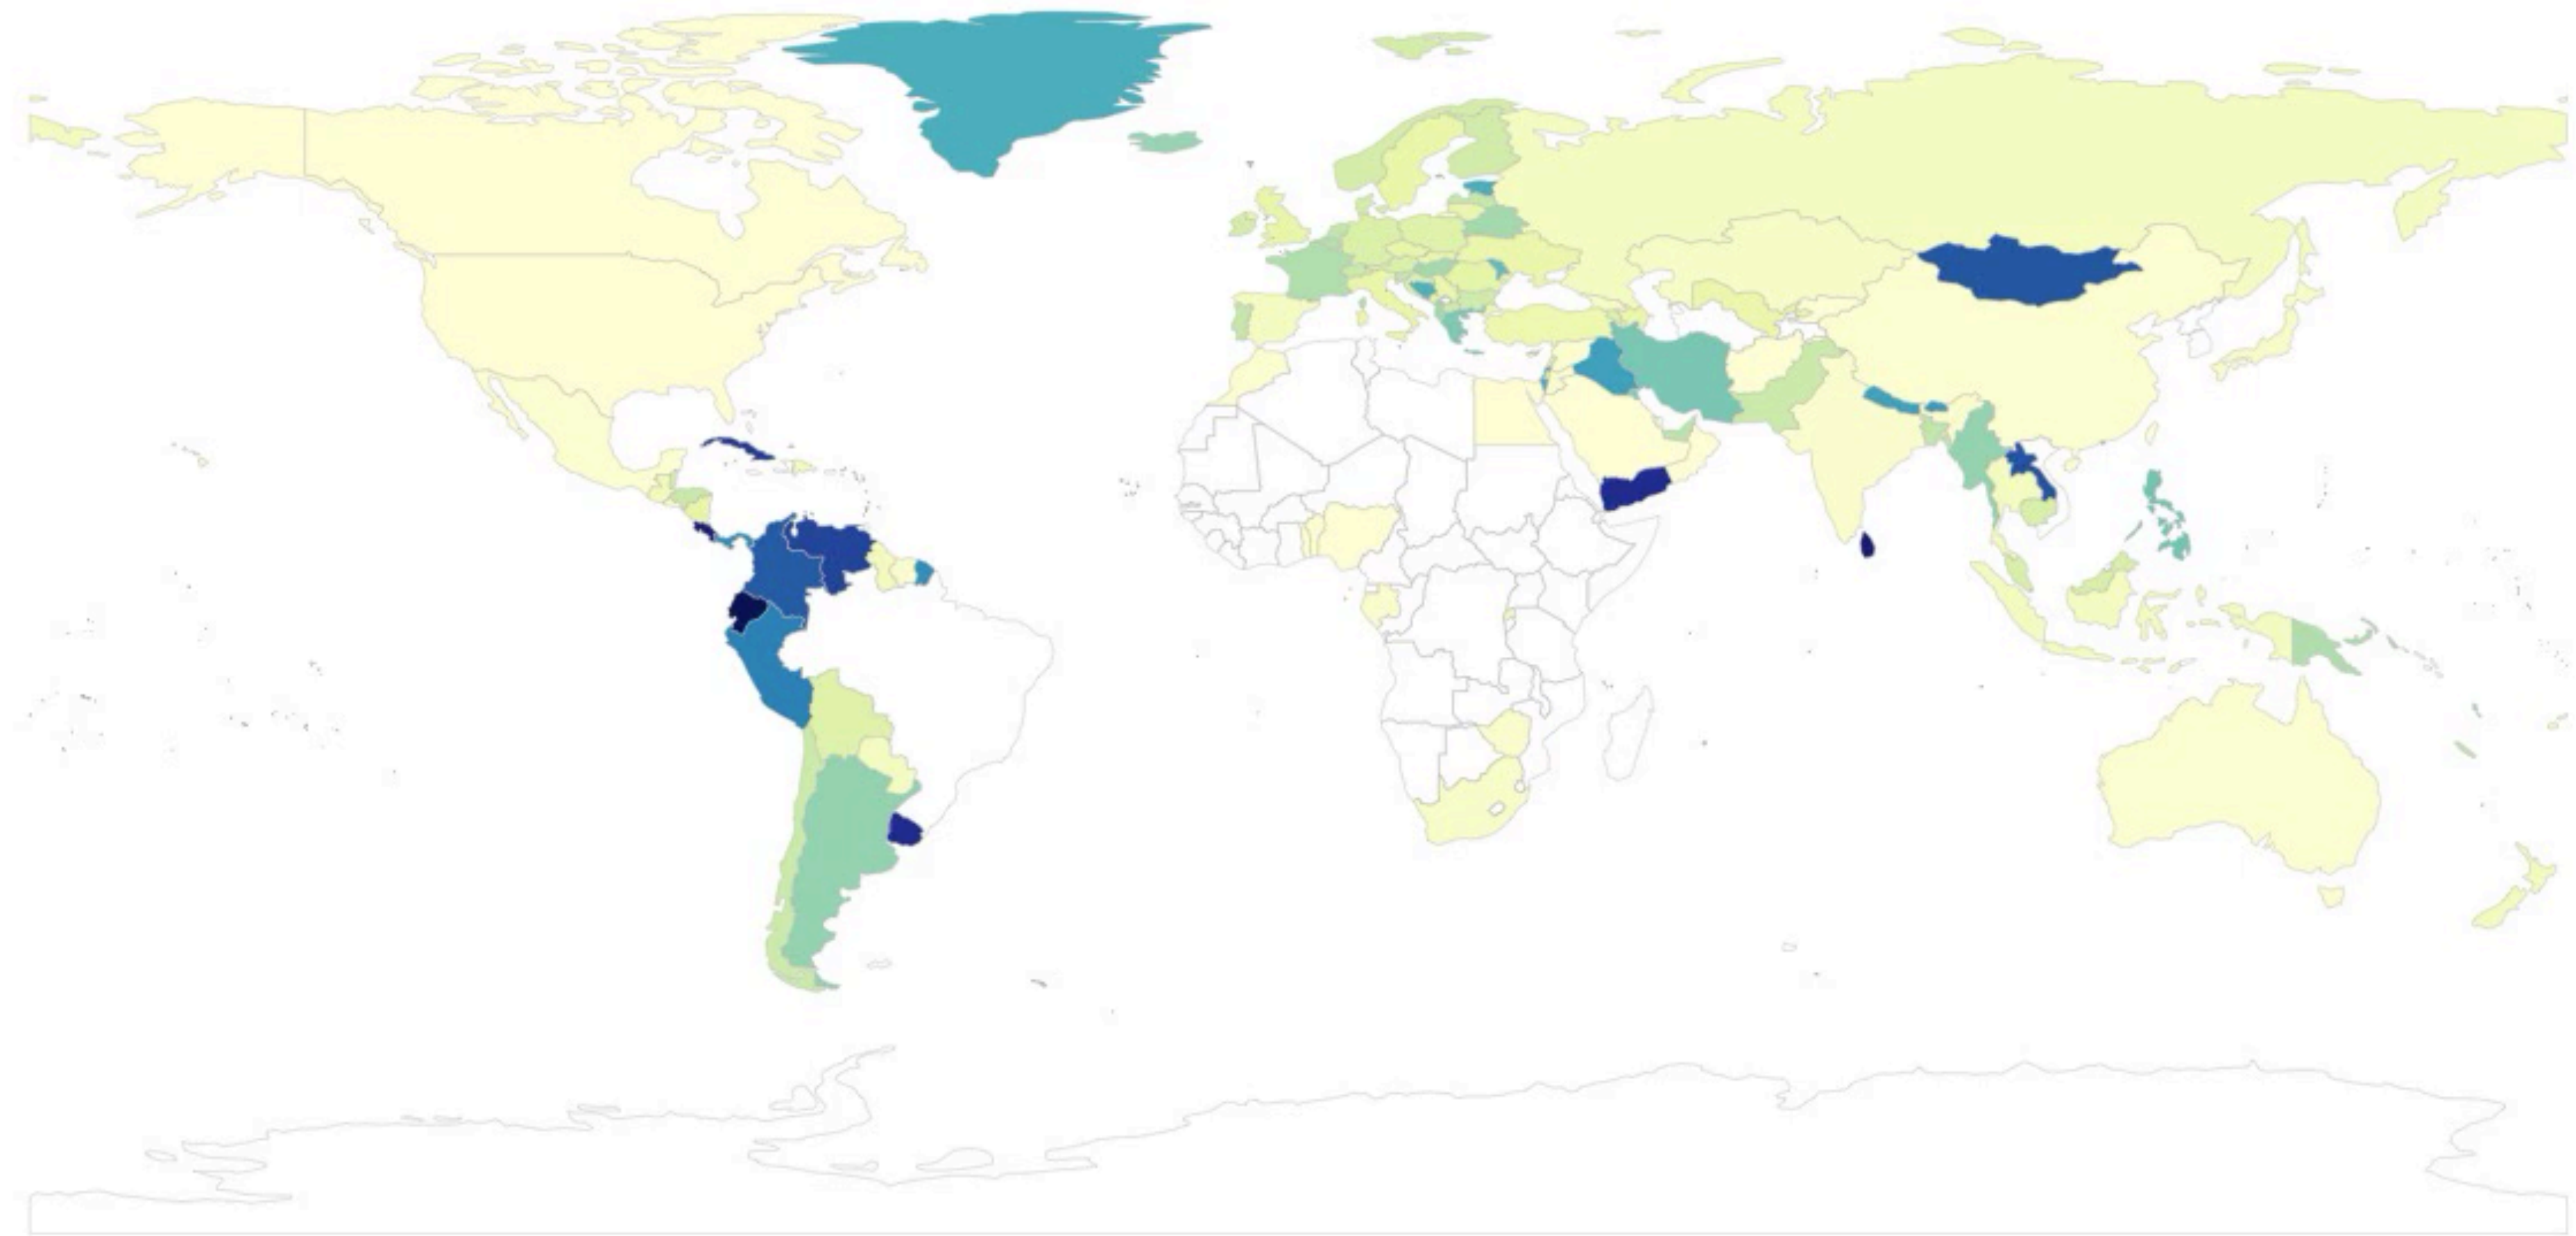

# For IPv6 same(-ish) thing

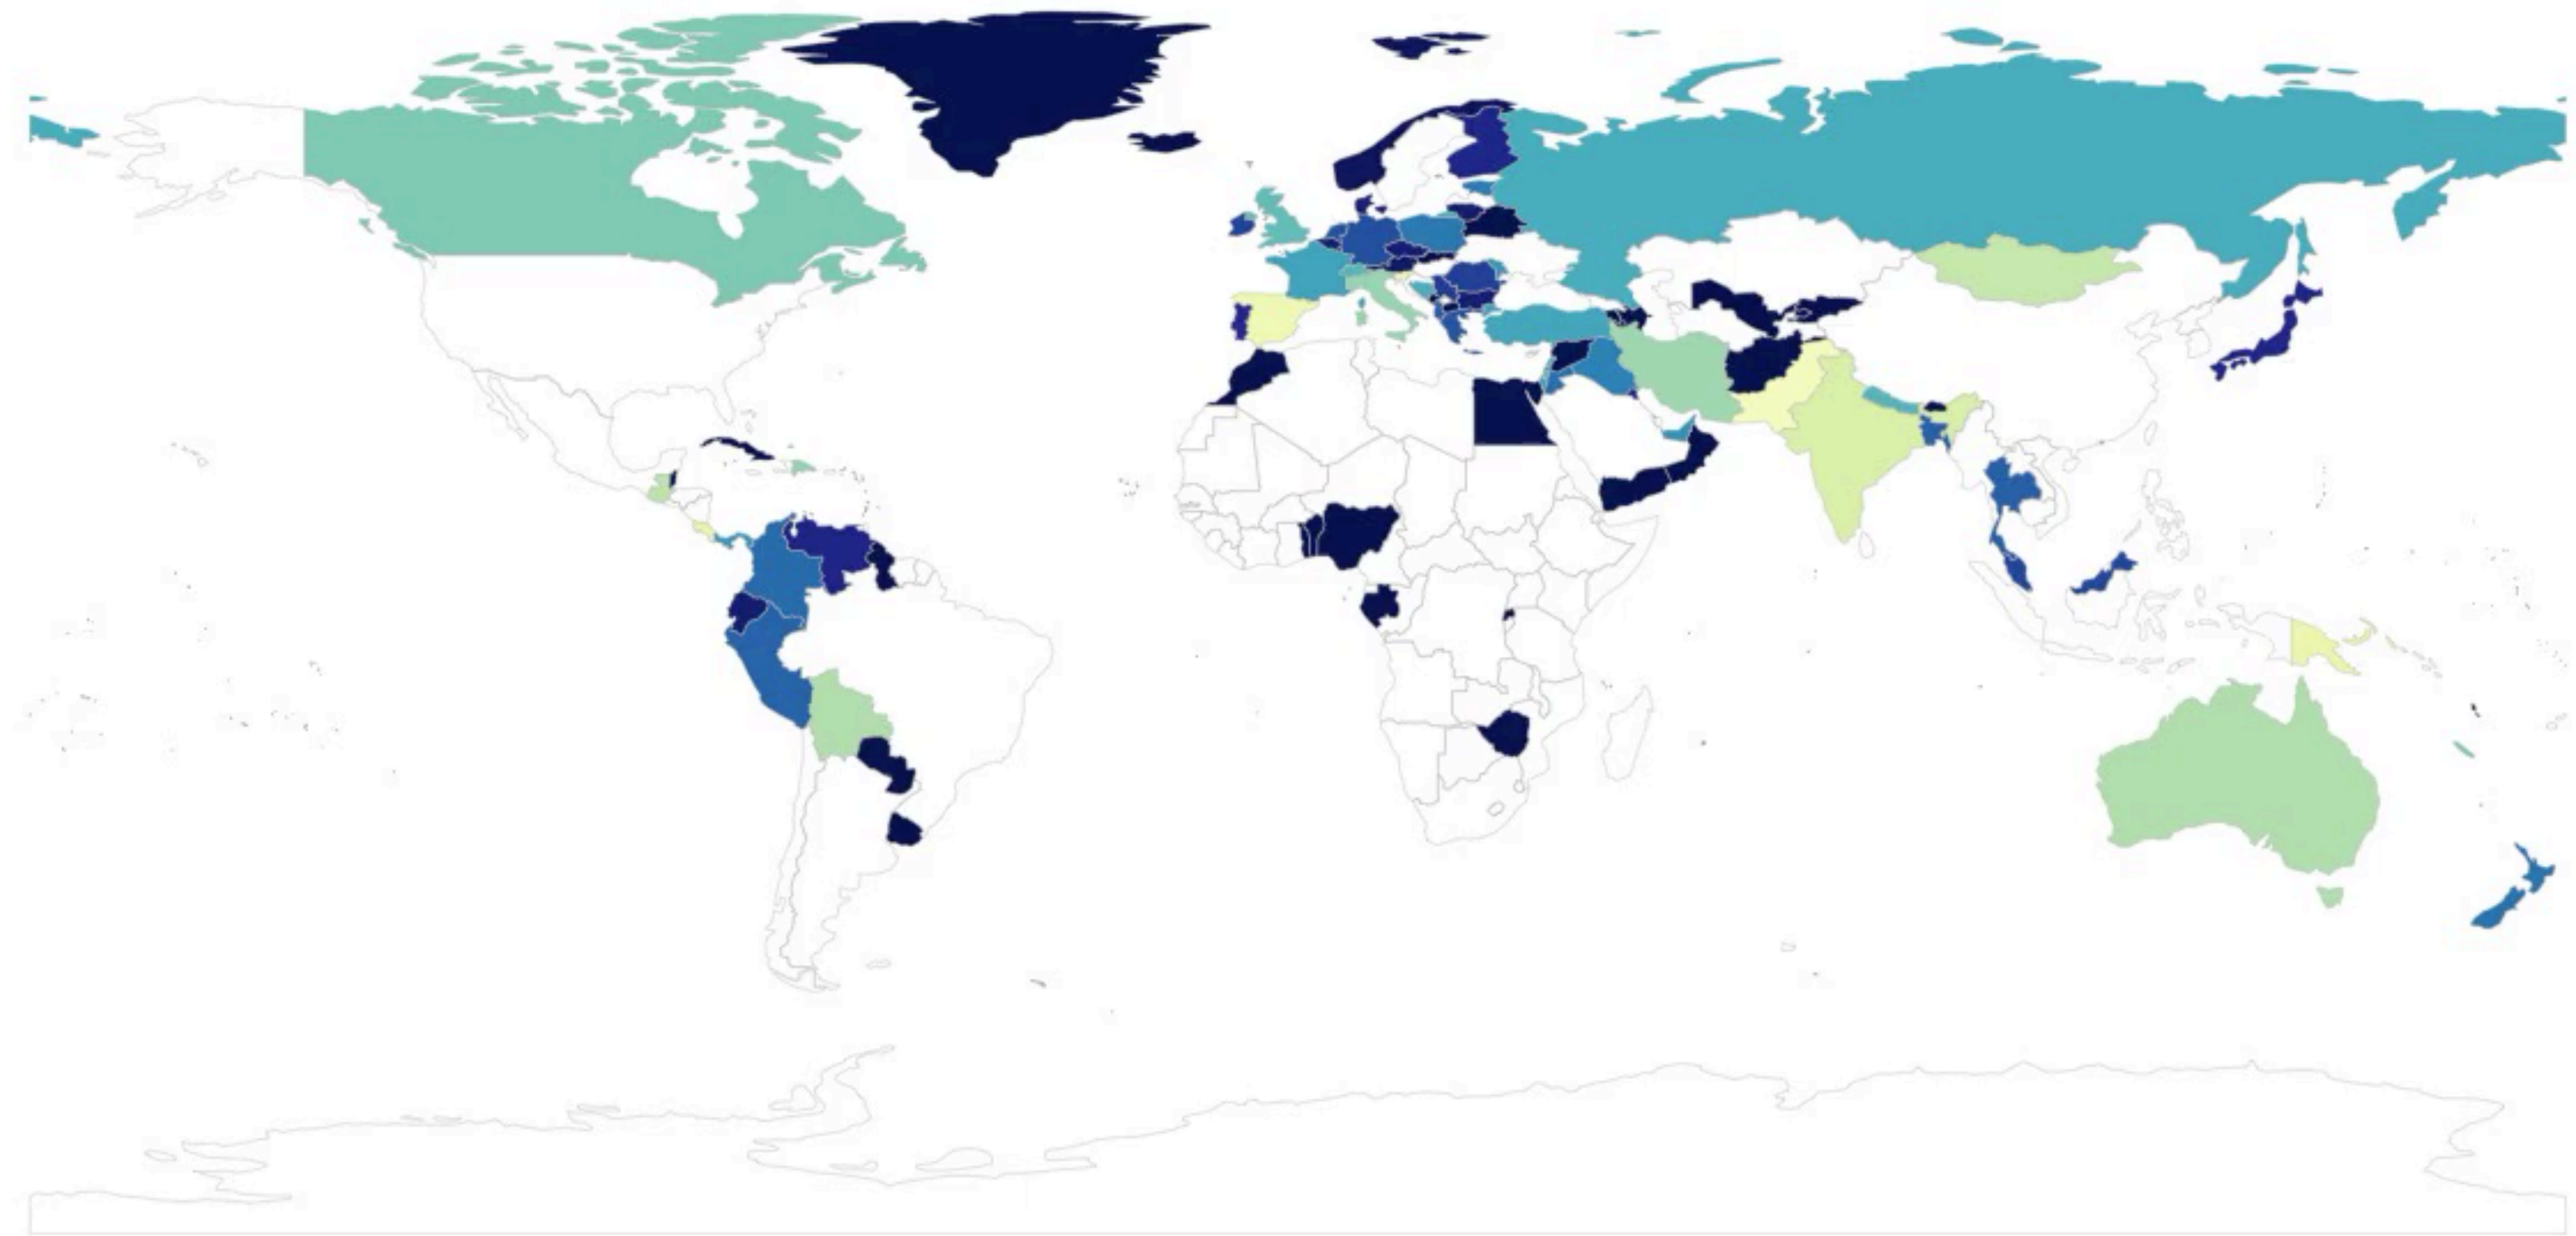

# Coverage over time

2018-04-01

# Accuracy over time

2018-04-01

# Conclusions

- We wanted to **test Routinator**; turns out **RPKI** use **took** some **time to stabilise to a** well-defined **standard**  
→ *Action item: support older standards in Routinator*
- Very **interesting data, raises** lots of **questions** and can help **study** how **RPKI** is deployed **in practice**
- **Next step: compare** this **against routing information** over the same period (from RIS, RouteViews, ...)  
→ *Paper to be presented at ACM IMC 2019 in Amsterdam, Oct. 21-23*

# Open data

- A big **thank you to** the **RIPE NCC** and to **Emile Aben** in particular for providing us with the RPKI dataset!
- The data is now also available as open data:  
<https://ftp.ripe.net/rpki>

# Grab our free OSS tools!

- Routinator:  
<https://github.com/NLnetLabs/routinator>
- Secure Routing Stats (experimental):  
<https://github.com/NLnetLabs/secure-routing-stats>  
(produces the graphs with world maps)
- Ziggy:  
<https://github.com/NLnetLabs/ziggy>

# Thank you! Questions?

and for "Team RPKI": [rpki-team@nlnetlabs.nl](mailto:rpki-team@nlnetlabs.nl)

# BONUS SLIDES

Some more graphs we got from Ziggy  
that didn't make it to the talk,  
because "time" ;-)

# Number of ASes with a VRP (IPv4)

# Number of ASes with a VRP (IPv6)

# Number of distinct prefixes (IPv4)

# Number of distinct prefixes (IPv6)

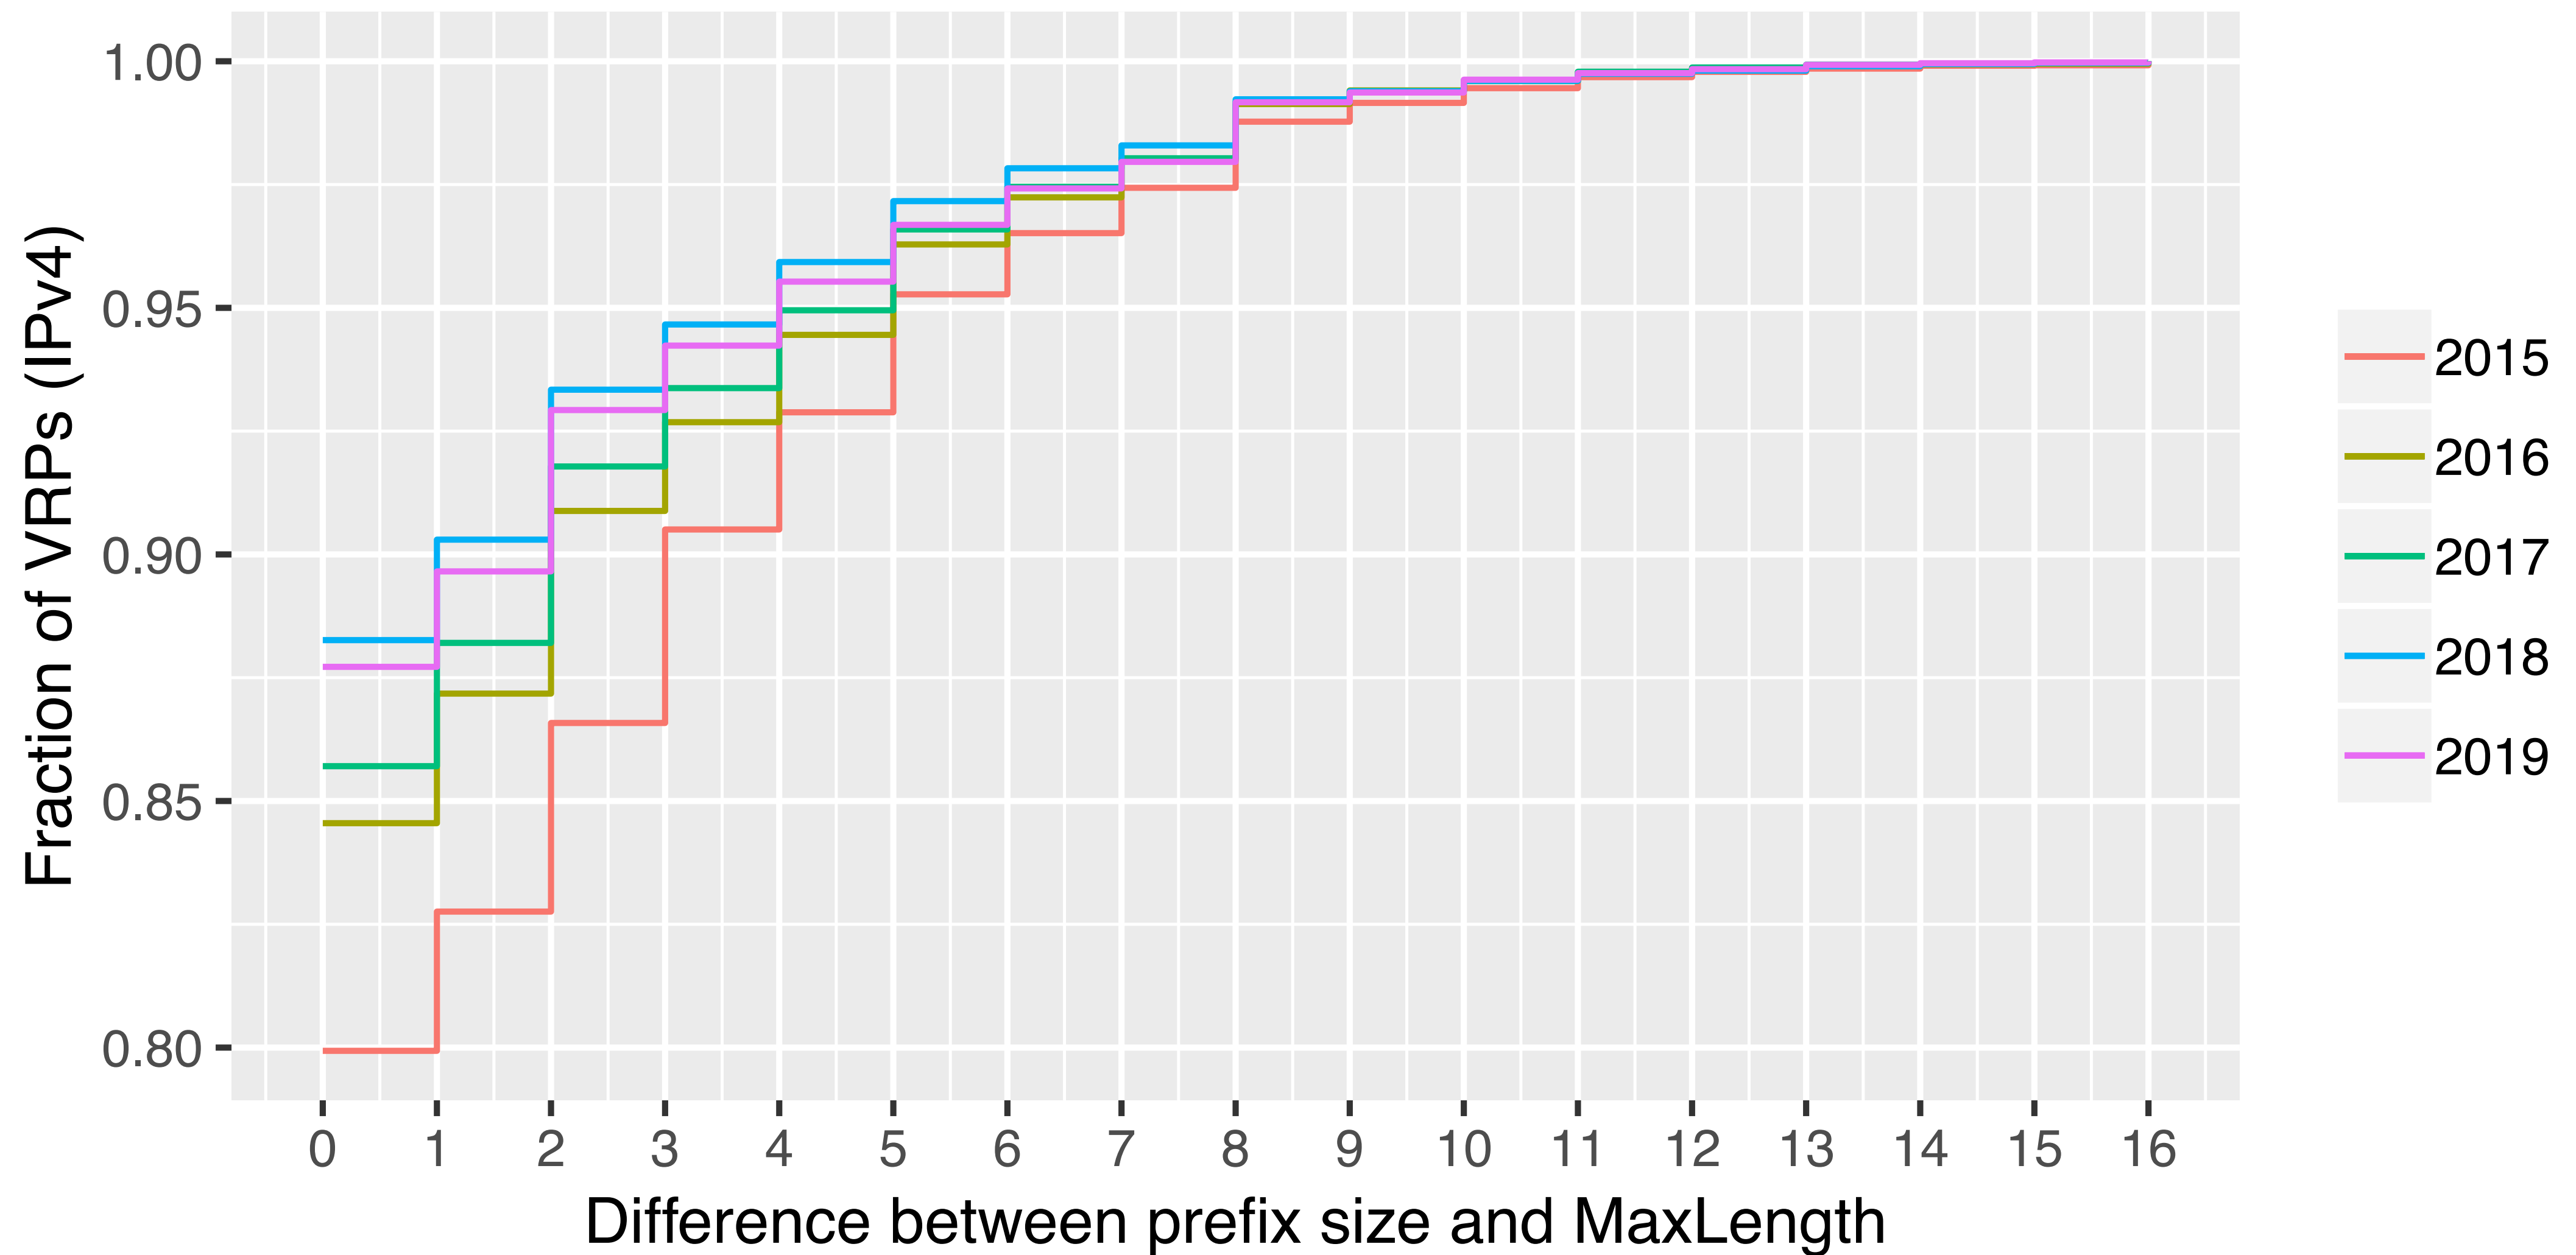

# Prefix size distribution RIRs (IPv4)

# Prefix size distribution RIRs (IPv6)

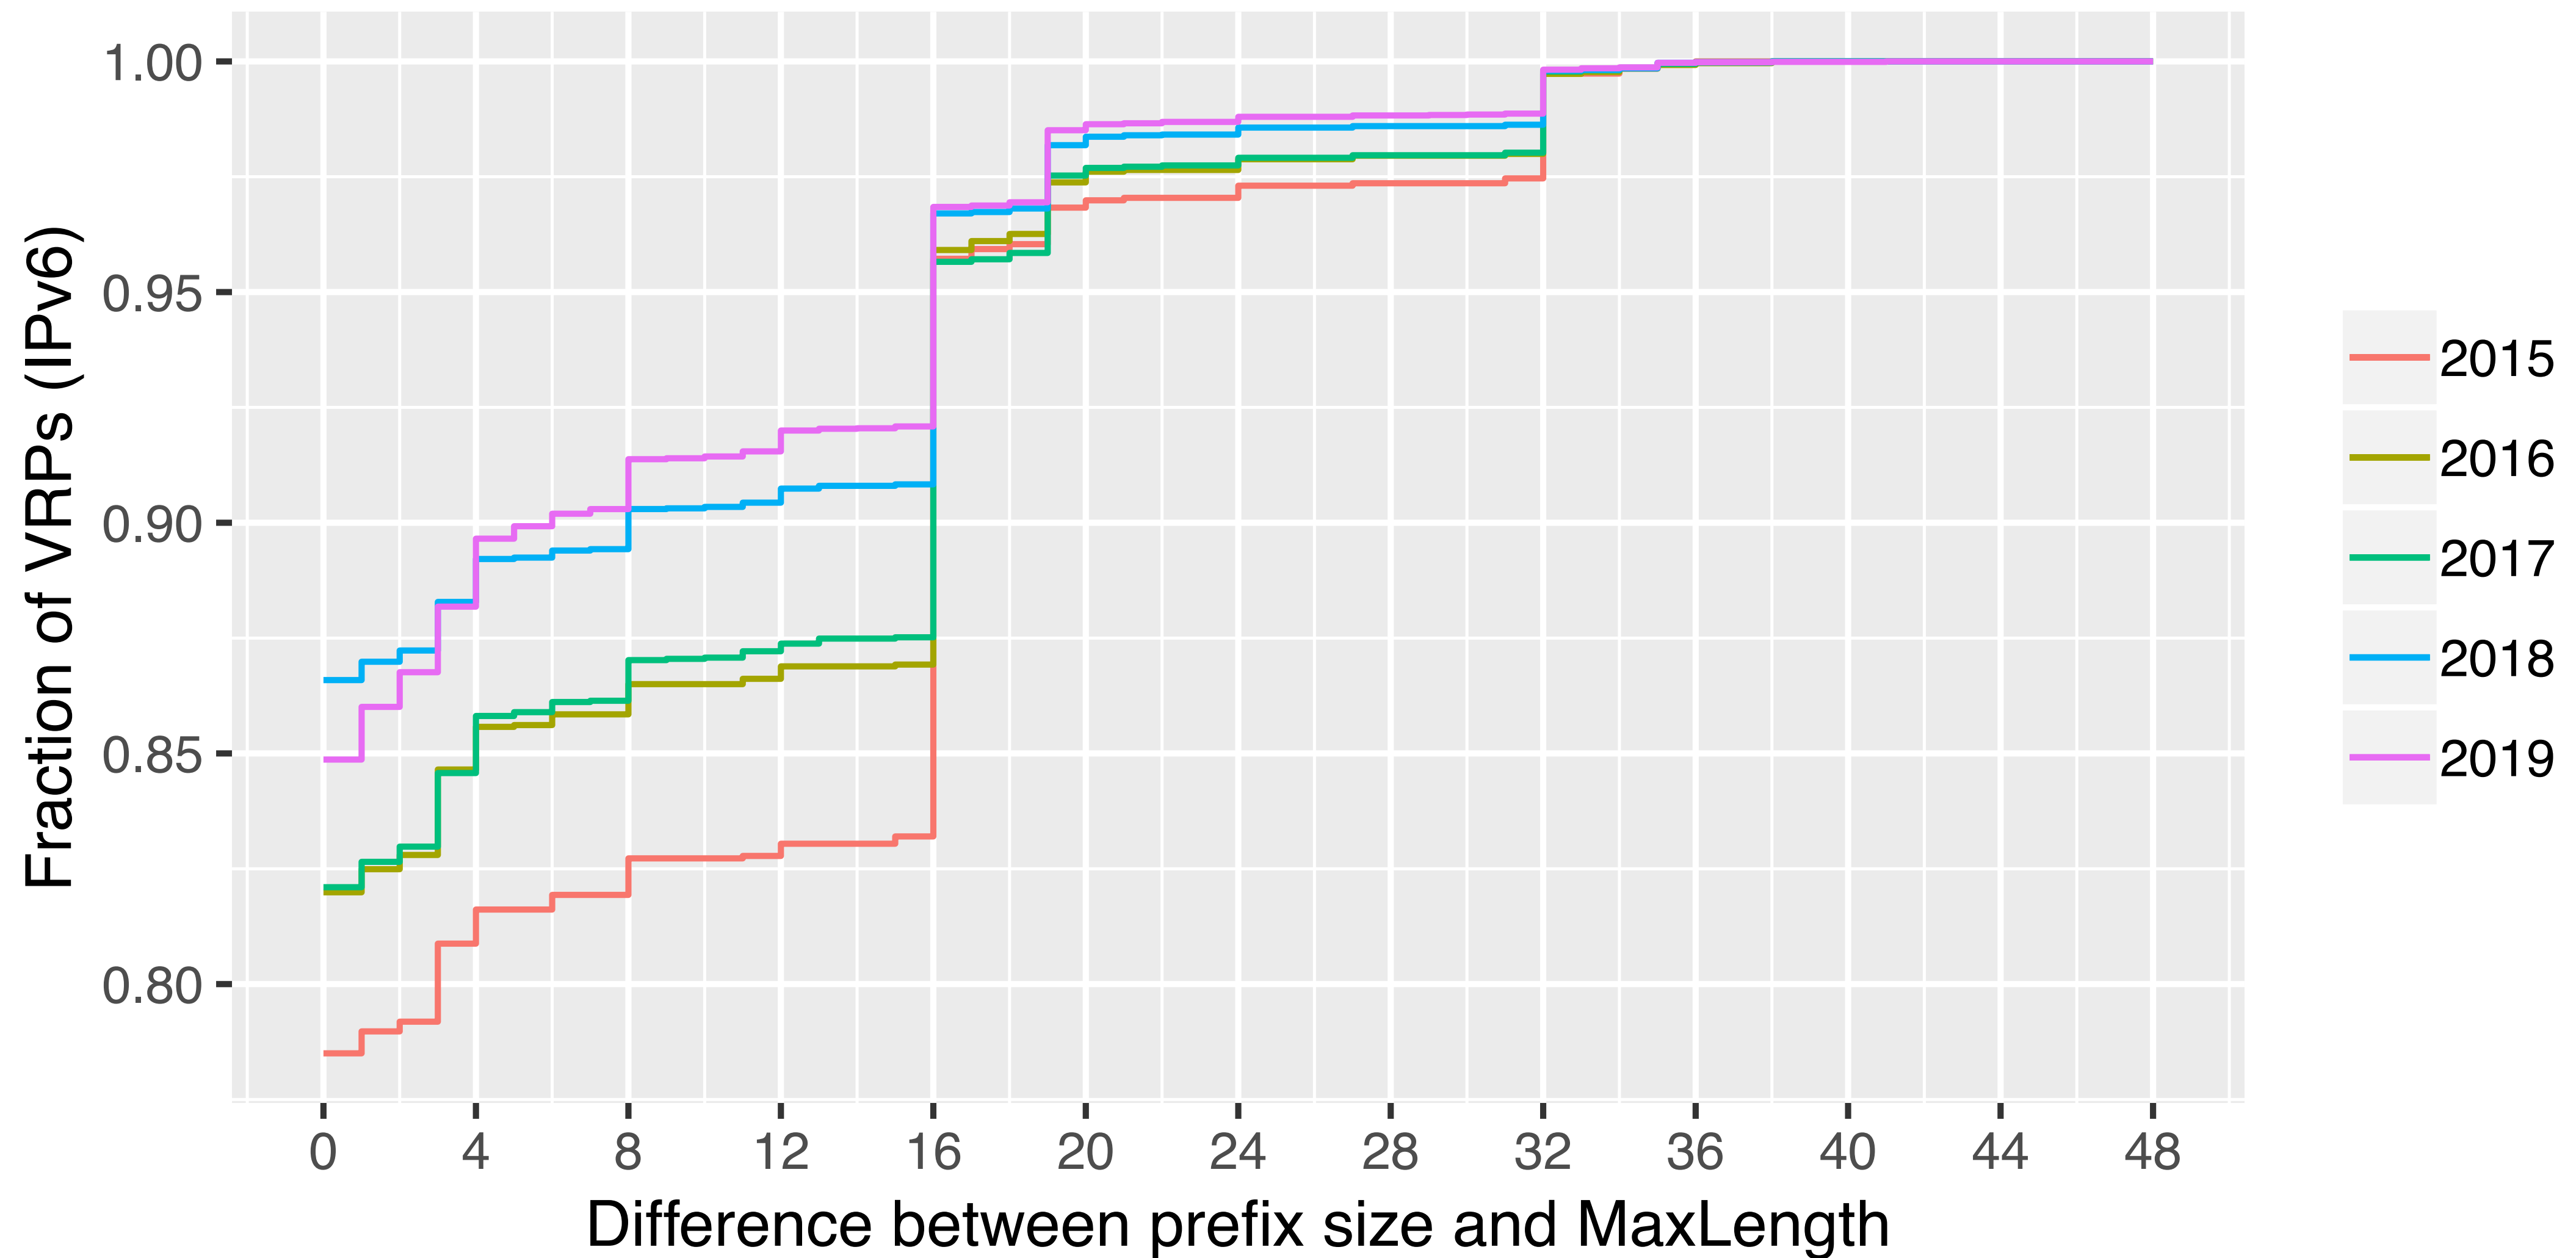

# Prefix vs. Max Length (IPv4)

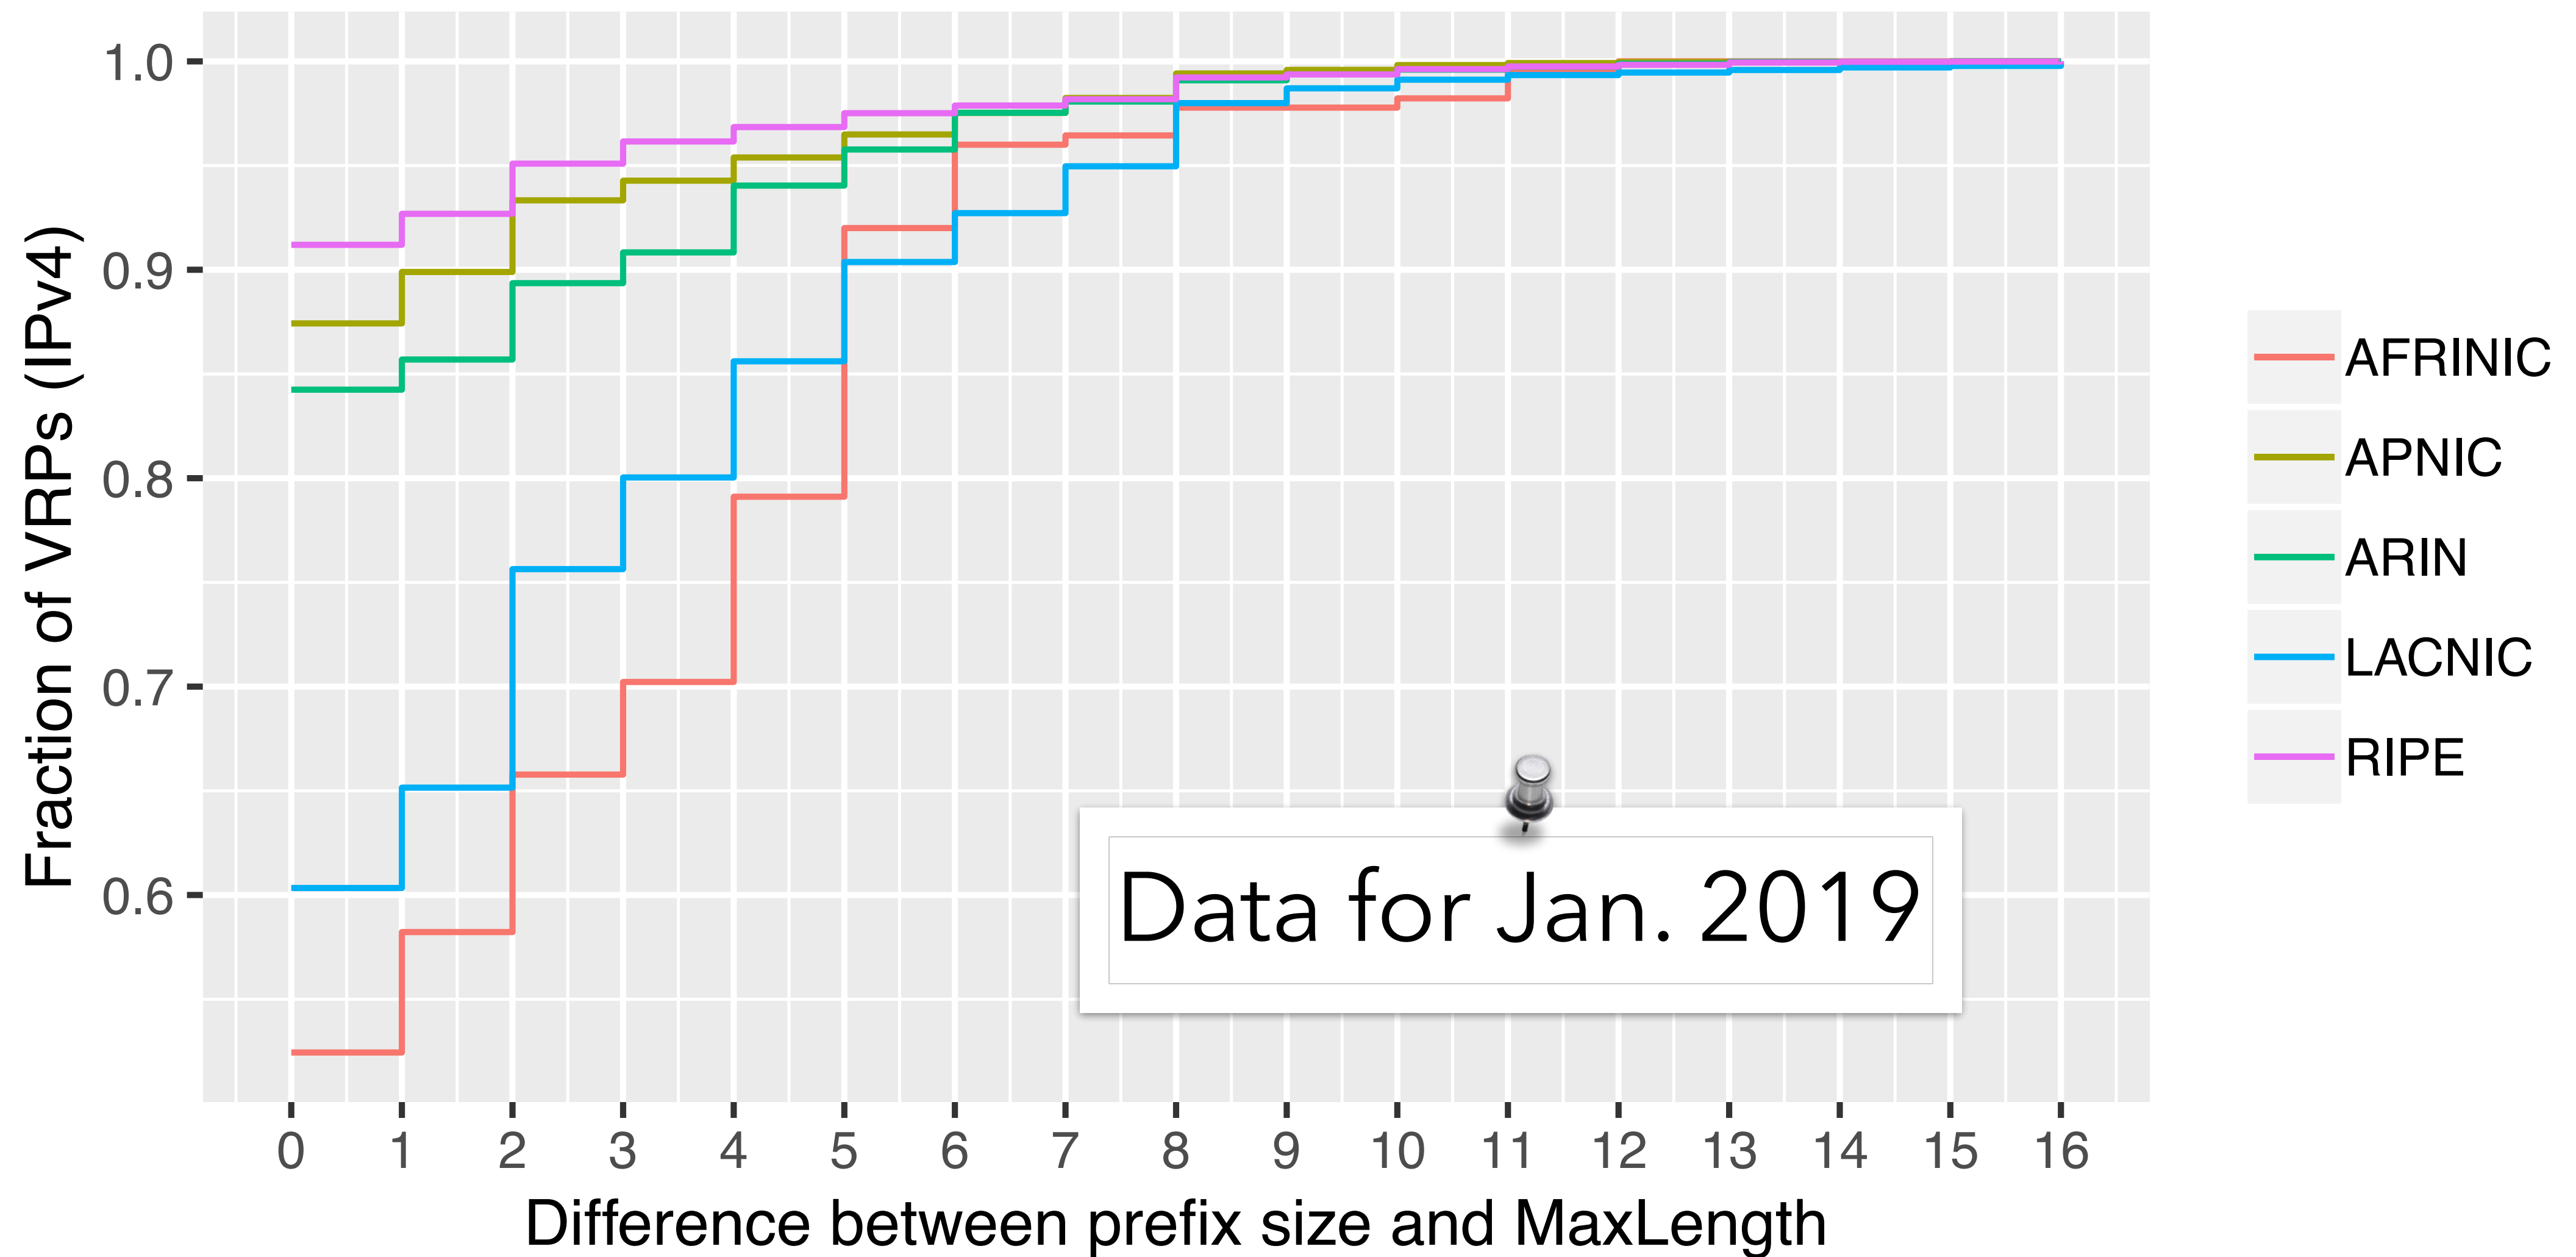

# Prefix vs. Max Length (IPv6)

# Prefix vs. Max Length RIRs (IPv4)

# Prefix vs. Max Length RIRs (IPv6)

# Differences between RIRs

Takeaway:

Max Length use differs significantly between RIRs
