

New directions

- So far we have,
 - defined a framework for IPPM
 - defined base metrics (loss, delay, connectivity,..) (at various stages in the standardization process) using the framework
- Now, we propose work on “derived” metrics under the umbrella of existing guidelines
- Outline
 - use basic definitions of IPPM to provide “less-generic” metrics
 - capture specific Internet behavior (such as loss burstiness, grouped packet losses, effect of Diffserv, etc) in terms of useful metrics
 - re-use as much of existing framework as possible, introduce new stuff where necessary, focus on the target application areas
