

One-Way [mumble] Measurement Protocol: General Issues

`draft-ietf-ippm-owdp-reqs-00.txt`

`draft-ietf-ippm-owdp-02.txt`

- People suggested having a better name that reflects more general purpose of the protocol than just delay measurement. How about “One-Way Active Measurement Protocol” (OWAMP)?
- We were asked to produce a requirements document. It’s in the I-D repository (`draft-ietf-ippm-owdp-reqs-00.txt`). Please comment on it.

OW*P Send Schedule

One issue that was left open *in re* the protocol itself was send schedules. We reached consensus that advance receiver's knowledge of send schedule and ability to specify it are required. The schedule specification should express common cases compactly and be able to express arbitrary schedule in some way.

Current plan: Have a repeating mini-schedule of the sort "send packet, wait exponentially distributed time with mean 1s, send packet, wait 20ms, send packet, wait 30ms." Is this good?
