Why NAI?

- ## NAI is an mobility entity identifier
  - Provides authentication identifier to the network
  - Provides unique identity to MN, independent of home address which may change over time
  - Presents the user and/or device to the network
  - Provides mechanism for HA to assign dynamic home address
  - Dynamic home address assignment allows dynamic HA assignment to happen

                    Should NAI be WG item?
