IPv6 @ Comcast

- Comcast is planning the deployment IPv6 now

- We are doing it primarily to manage our own devices

  - Net 10 is just too small

- We would like to have "trial balloon" services to gauge customer interest in having IPv6 service in the home before our infrastructure is fully ready.

comcast.

What do we need?

- Something **<u>NOW</u>**! (read asap)

- Something easy to deploy by the customers

- Something supported and standardized

- Something that can be integrated easily in our current IPv4 management infrastructure

- Limited functionality is a feature, not a bug

    – The real thing has to be better!
