Route Construction

Jonathan Rosenberg
Cisco Systems

Problem Statement

- Many mechanisms for setting the Route in a request
 - Service Route
 - Configured and default outbound proxies
 - Record-Route
 - Loose Route
- Confusing in a UA what to do
- Service-Route has major limitations

Service-Route Problems

- UA behavior not actually specified
- Proxy behavior not actually specified
- No interoperable way for outbound proxies to stay on path
- No ability to change outbound proxy for purposes of HA or maintenance

Draft Status

- Once again completely redone
- Changes
 - New backwards compatibility mechanism
 - Very complex 3xx mechanism replaced by simpler loose route technique, now in loose route draft

Proposed Mechanism

- Registrar reflects Path URI into Service-Route, just like Record-Routes
- Main issue is backwards compatibility
 - UA includes Supported
 - Proxies include flag in Path
 - Registrar tells UA to append Service-Route on outbound proxy when outbound doesn't support, else replace
- Result is backwards compatible with IMS

Open Issues

- Do we really need to know if proxies along the path support this? Perhaps just outbound proxy?
 - Requires some input from IMS vendors
