

draft-ietf-ecrit- additional-data-02

Brian Rosen
Hannes Tschofening
Roger Marshall

Reminder of what this is

- Way to get data from service providers and devices into a PSAP (and then to responders)
- Contains
 - SP ID, contact and “class of service” data
 - Subscriber data
 - Device data
 - Hook for device/service specific data
- Comes in
 - Call Info header in SIP (or cid, with data in body) for device or origination SP data
 - Provided-by element of PIDF for access SPdata

Changes from prior version

- Introductory sections rewritten to provide more background
- XML schema rewrite
- Fewer NENAisms
- Allow more than one service delivered value
- Added URI (schema) enumeration for device/service specific data
- Better (but not finished) IANA considerations

What's next

- Authors believe the technical content is getting very close to finished
- Mostly, more review and any other ideas for more data is needed from the WG
- Authors will sweat the details and get ready for WGLC
