

NETCONF System Management

draft-ietf-netmod-system-mgmt-03
IETF 85, November 2012

Andy Bierman
Martin Bjorklund
November 6, 2012

Agenda

- Changes since -02
- New RADIUS objects?
- Ready for WGLC?

Change Summary

- removed configuration-source identities
- removed configuration-source leaf from ntp and dns to choose configuration source
 - now relying on a generic solution to solve the data source identification problem
 - draft-bierman-netconf-get2-02.txt proposed a solution for this problem

RADIUS enhancements

- Email from Jeffrey Lange requesting more objects to identify the authentication type
 - 1) Should this be included in the draft
 - 2) Should more types be defined (MS-CHAP / MS-CHAPv2 / SIP Digest / LEAP / Cisco LEAP / etc...), this gets tricky for things like EAP-TLS where you also need to configure keying material.
 - 3) How does the client determine which auth types the server supports?

Proposed Changes

- Add radius-authentication-type identity base and define some initial identities
- Add authentication-type leaf to /system/radius container

Ready for WGLC?

- Is the -03 draft ready for a working group last call?
 - No new features added recently
 - We may continue to get requests for new objects as long as the work item is open
