

ROLL Working Group

**Industrial Deterministic Routing Extension for LLN
draft-wei-roll-scheduling-routing-01**

Min Wei, Heng Wang, Ping Wang, Chao Zhou

IETF 85 Atlanta, USA

Nov. 5th, 2012

● The Problem

- RPL is expected to be more suitable for industrial application.
- The requirements from the industrial environment for a routing protocol in Low power and Lossy Networks (LLNs) is analyzed in [RFC5673].
- Determinism is one of the most important requirements in industrial application. In industrial wireless application, cross-layer design needed to be considered to promote the performances of the determinism scheduling, which is not only related to link layer, but also affects the routing.

● Standard Analysis

- Low Latency Deterministic Networks (LLDN) is specified in IEEE 802.15.4e, which is organized with a superframe structure and using low latency frames.

- It is for industrial application
- Deterministic is key point

Notice	This document has been prepared to assist the IEEE 802.15. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.
Release	The contributor acknowledges and accepts that this contribution becomes the property of IEEE and may be made publicly available by IEEE.

- All of these exciting industrial wireless standards essentially address the same physical space where wireless can be used for industrial applications.
- It uses **determinism scheduling mechanism** makes certain nodes communicate in certain slot.

● Industrial Routing Requirements

- ROLL Working Group has defined application-specific routing requirements for routing protocol in [RFC5673]
- This RFC provides information on the varying deployment scenarios for such LLNs and how RPL assists in meeting those requirements.
- Therefore, we suggest some specific metric should be considered, so that
 - **RPL could become more widely used in industrial application**
 - **It is good for the RPL used in some applications, such as base on IEEE802.15.4e**

● The Opportunity

- The routing metrics and constraints are specified in [RFC6551], which provides a high degree of flexibility and a set of routing metrics and constraints.
- This document specifies Object-Scheduling Waiting Time as the routing metrics and constraints to be used in path calculation for Low Latency Deterministic Networks.
- The new metrics and constraints we define in this document could be advertised as a metric to optimize the computed path and as a constraint.

• Definition

- ◆ **Scheduling waiting time:** The time is used to for a node have to wait to send data to a special node in a period. When the MAC layer schedules the slot time and channel resources of network with TDMA mechanism, each node gets send slots and receive slots.
- ◆ **Determinism:** It is usually meant that access to the control network by a node may be delayed, where t is known. In industrial wireless network, it also means that data is sent and received within the stipulated time.

• Scheduling Waiting Time Object

```
0                               1
0 1 2 3 4 5 6 7 8 9 0 1 2 3
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
| (sub-object) .....
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
```

Scheduling Waiting Time Object Body Format

```
0                               1                               2                               3
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
|                               Scheduling Waiting Time                               |
+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+--+
```

Scheduling Waiting Time sub-object Format

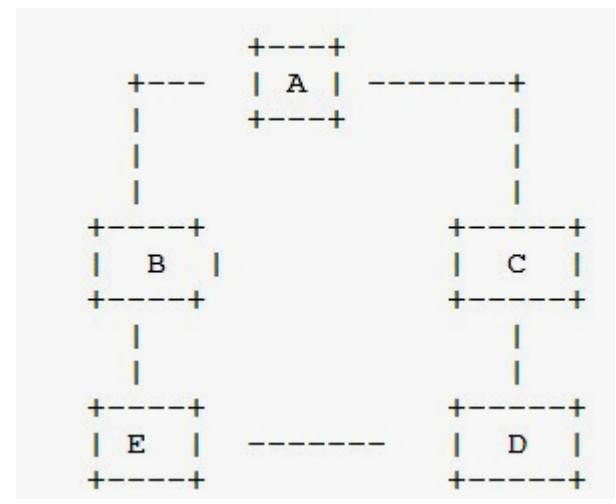

- **Mode of Operation**

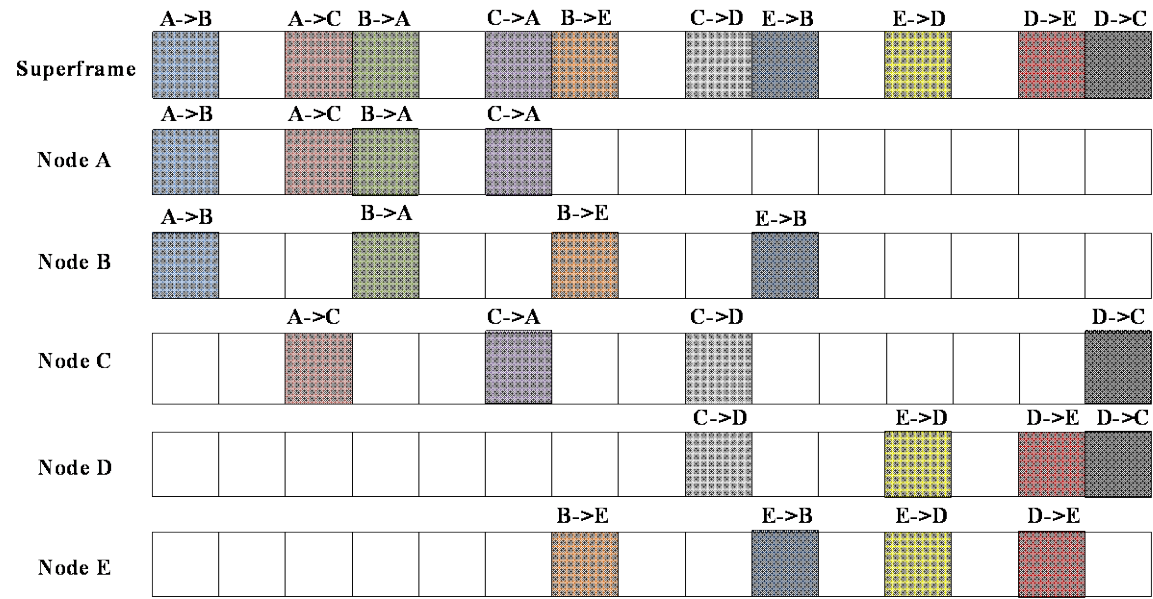

- The Scheduling Waiting Time may be used as a constraint or a path metric.

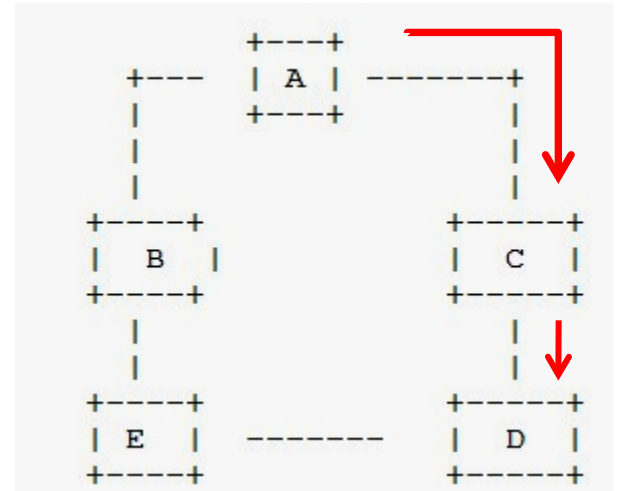

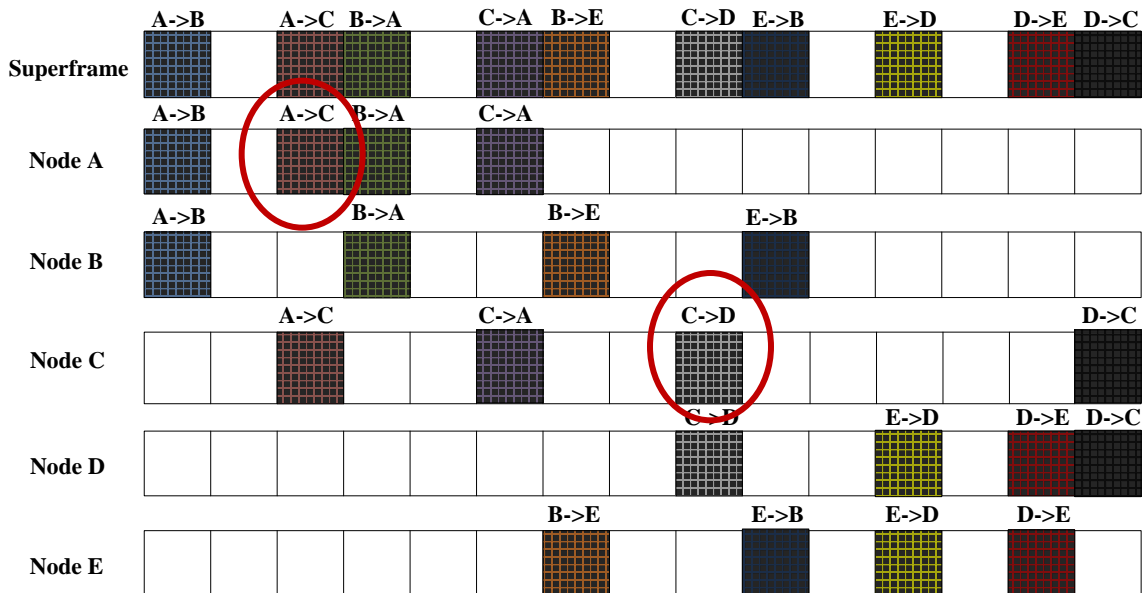

- Scheduling Waiting Time object common header indicates that the provided value relates to a constraint.
 - Scheduling Waiting Time object may be used as an aggregated additive metric where the value is updated along the path to reflect the path Scheduling Waiting Time.
- 

- There is an instance to explain how to use Scheduling Waiting Time object to be as a metric and constraint. The topology of the network is show as Figure.

- There are 15 timeslots in the superframe, which has been allocated to each node. We define them as timeslot 1, timeslot 2 ... timeslot 15. Here, we define a timeslot as 10 ms.

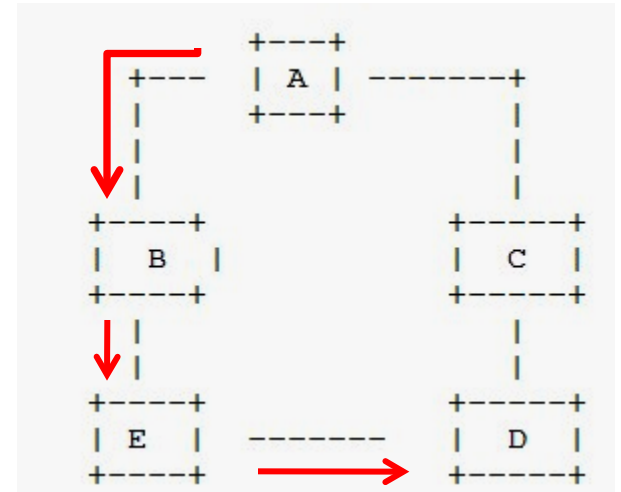

A->C: $3 * T_{slot} = 30ms$

C->D: $6 * T_{slot} = 60ms$

A->C->D: 90ms

A->B: $1 * T_{slot} = 10ms$

B->E: $6 * T_{slot} = 60ms$

E->D: $5 * T_{slot} = 50ms$

A->B->E->D: 120ms

- IANA Considerations

Value	Meaning	Reference
1	Node State and Attribute	RFC6551
2	Node Energy	RFC6551
3	Hop Count	RFC6551
4	Link Throughput	RFC6551
5	Link Latency	RFC6551
6	Link Quality Level	RFC6551
7	Link ETX	RFC6551
8	Link Color	RFC6551
9	Scheduling Waiting Time	This document

- **Note: It is different from the Link Latency.**
- 

• Conclusion and Future Work

- This document defines a new Scheduling Waiting Time Object for RPL to support scheduling mechanism and to meet the industrial requirement of determinism.
- It could be used as one of the multi-metrics and work with the others. When using a dynamic routing metric in LLND, a RPL implementation should use multi-threshold schemes to void spurious and unnecessary routing changes. For the object format structure, the additional field is not added.
- The reserved bit is used. However, the new object needs to be transmitted during the networking stage, which in fact needs extra overhead of 4 bytes.
- While the network scheduling information changes, we need re-send a new value. Otherwise, if network scheduling information does not change, there is no need to send new value.

- **Conclusion and Future Work**

- Cooperate with other groups (e.g. HCF, WIA-PA, ISA and IEC) to make this a success
 - P802.1Qbu
 - P802.1Qbv
 - SAE AS6802

Thanks !
