

Authentication Requirement Options

- 1) Reauth MUST happen before SA expires
- 2) Unprotected notice from server that client needs to reauth when server has message to send
- 3) Notice in #2 is not unprotected, but rather is protected via expired SA
- 4) Server can use expired SA for a given mapping to protect any unsolicited **unicast** message it sends regarding that mapping
- Rough consensus in room to start the discussion based on option 4
