

# RADIUS

## Extended Request

draft-deacon-radext-extended-request-00

# Introduction ...

20..21...22.....4096

“The minimum length is 20 and maximum length is 4096.”  
-- RFC 2865 sec 3.

0..1...2.....4096.....8192.....12288.....65535

.. or ..

# Goals

## Minimize Surprise

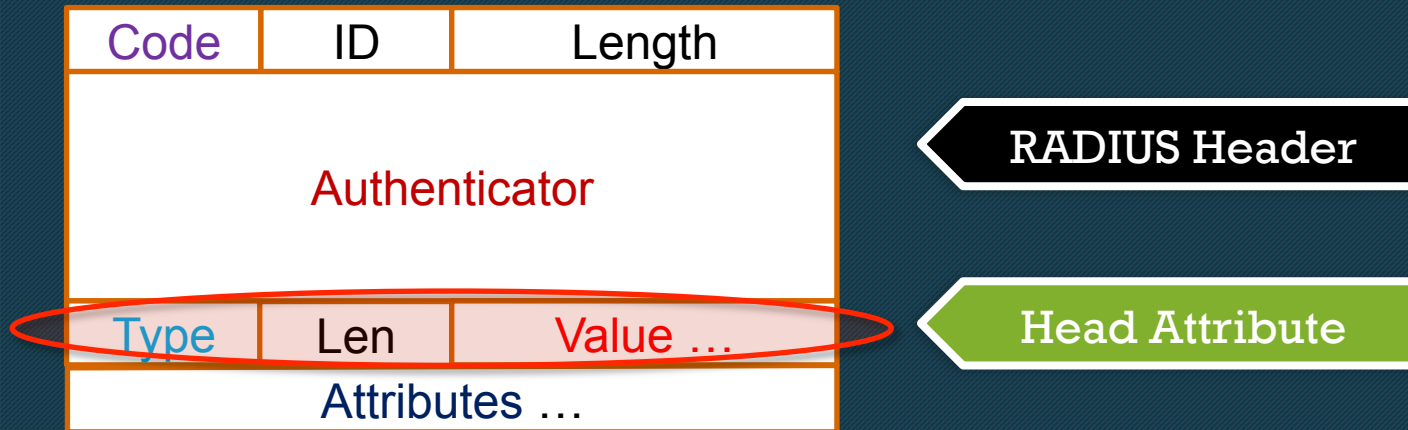

- Fragment-Data used only where necessary
- **Clients** transmit large requests only while supported by **server**
- **Servers** transmit large responses only while supported by **client**

## Plug and Play

- **Client** and server automatically discover large packet support
- **Clients** automatically obtain administrative limits from **servers**
- **Servers** discover large response support of **client** and proxy path
- Signal **server** support for TCP and TCP large packet to **clients**

# Extended-Request

**Section 3** “An Extended-Request packet is sent to the RADIUS server requesting an action whose purpose is determined by an attribute present immediately after RADIUS header within the RADIUS packet”

## Head Attributes

**Fragment-Data** Facilitates fragmentation of RADIUS packets beyond 4096 bytes

**Fragment-Inquire** Requests fragment related capabilities and parameters from RADIUS server

# Extended-Response

Code	ID	Length
Authenticator		
Attributes ...		

Indicates success in response to Extended-Request. Response attributes may be included per Extended-Request head attribute specification.

# Extended-Reject

Code	ID	Length
Authenticator		
Attributes ...		

Communicates failure of Extended-Request. Error-Cause attribute may be included to provide feedback to client.

# Fragment-Data

Command Code Summary

RADIUS Client

Extended-Request

RADIUS Server

## Extended-Request

- On **RADIUS Request** transmits (Inner) Request to **Server**.
- During **RADIUS Reply** used to request next Fragment from **Server**.

RADIUS Server

Extended-Response

RADIUS Client

## Extended-Response

- On **RADIUS Request** transmits Fragment Ack to **Client**.
- During **RADIUS Reply** transmits (Inner) Reply to **Client**.

RADIUS Server

Extended-Reject

RADIUS Client

## Extended-Reject

- On **RADIUS Request** transmits Fragment failure to **Client**.
- During **RADIUS Reply** Extended-Reject is unused.

# Fragment-Data

RADIUS **REPLY** Extended-Request

**Code** = Extended-Request  
ID, Len, **Authenticator** = Same  
as **Accounting-Request**

**Type**=Fragment-Data  
**Code**, **Flags** (Cont=1),  
**Sequence**, **Authenticator** =  
Echoed from last received  
Extended-Response

# Sample Flow (Access Request)

Extended-Req C=0,M=1,Seq 1

Extended-Response

Extended-Req C=0,M=1,Seq 2

Extended-Response

Extended-Req C=0,M=0,Seq 3

Fragments assembled internally as Access-Request then processed normally.

Final Extended-Req acknowledged by Extended-Response

Extended-Req C=1,M=1,Seq 1

Extended-Res C=0,M=1,Seq 1

Extended-Res C=0,M=0,Seq 2

Assembled fragment processed normally as Access-Accept or Access-Reject.

# Retransmission Overview

1

**RADIUS CLIENT** drives retransmission.

Outer Extended **Request/Response** identical behavior to Accounting Request/Response.

At any time if response is not received last unacknowledged Request or **Extended-Request** is retransmitted.

2

Acknowledgement of final (More=0) fragment is **Extended-Response** containing RADIUS response (e.g. Access-Accept)

**Clients** may elect to reduce retry timers when transmitting non-final (More=1) **Extended-Requests**.

# Retransmission Example (Request)

Extended-Request, Seq 1

Extended-Response

Extended-Request, Seq 2

~~Extended-Response~~

Extended-Request, Seq 2

Extended-Response

Extended-Request, Seq 3

...

# Retransmission Example (Reply)

The diagram illustrates a sequence of network messages. On the left, three orange arrows point right, representing requests. The top one is labeled 'Extended-Request (Echo 1)', the middle one 'Extended-Request (Echo 2)', and the bottom one 'Extended-Request (Echo 2)'. On the right, four green arrows point left, representing responses. The top one is 'Extended-Response, Seq 1', the second is 'Extended-Response, Seq 2', the third is 'Extended-Response, Seq 3', and the bottom one is 'Extended-Response, Seq 3'. A large orange 'X' is superimposed over the 'Extended-Response, Seq 3' message, indicating a retransmission. Ellipses '...' are centered below the bottom-most request arrow.

# Fragment-Data

“Inner” Req/Reply Authenticator

## Access-Request

“the Authenticator value is a 16 octet random number” --RFC 2865

## Access-Accept, Access-Reject, Access-Challenge

“MD5(Code + ID + Length + RequestAuth + Attributes + Secret)” --RFC 2865

## Message-Authenticator

“HMAC-MD5 [RFC2104] hash of the entire Access-Request packet, including Type, ID, Length and Authenticator, using the shared secret as the key”

--RFC 3579

## Accounting-Request, Disconnect-Request, CoA-Request

MD5(Code + ID + Length + 16 zero octets + request attributes + Secret)

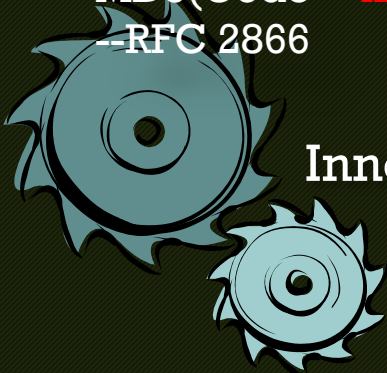

--RFC 2866

## Accounting-Response, Disconnect-ACK/NAK, CoA-ACK/NAK

MD5(Code + ID + Length + RequestAuth + response attributes + Secret)

--RFC 2866

Inner packet generated normally with ID field set 0.

# Fragment-Data

Constructing the "Inner" Packet

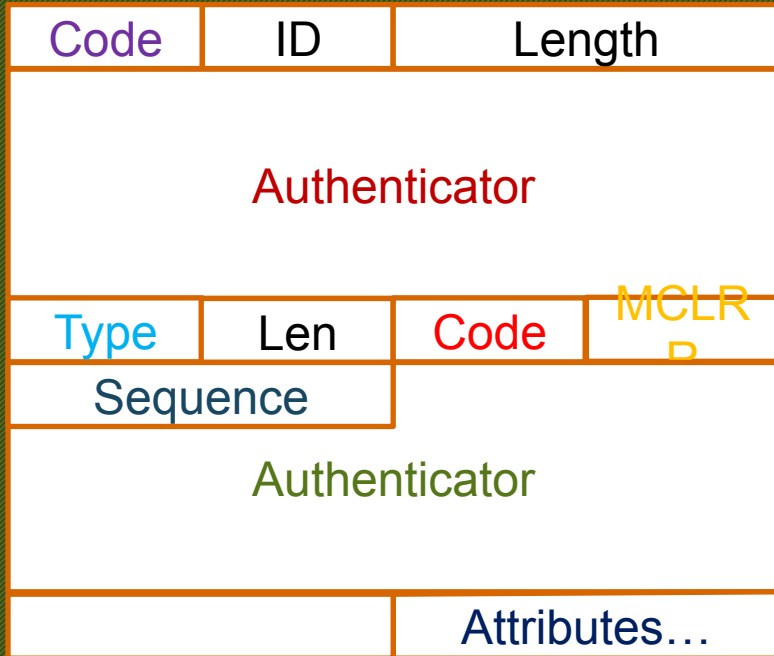

Code	ID	Length	
Authenticator			
Type	Len	Code	MCLR P
Sequence			
Authenticator			
		Attributes...	

Code	ID=0	Len=24 +
Sum frag attr		
Authenticator		
		Attributes
		Attributes
		Attributes

# Fragment-Data

➤ "Outer" vs. "Inner" Processing

**+--+--+--+Outer Packet+--+--+**

Consumes head attribute (Fragment-Data) only.

**ALL** additional attributes are appended to "Inner" request byte for byte with no changes.

AVP length fields validated against total "Outer" packet length. No checking is done with respect to type or content of attributes at this stage.

**+--+--+--+Inner Packet+--+--+**

Once all fragments are assembled inner packet is constructed and processed normally as if received on "wire".

# Fragment-Data ➤

RADIUS Response Options

## Responding to Fragmented Request

- The “Inner” **Fragmented** request (Authenticator) is used to produce **Fragmented** response.

## Responding to Non-Fragmented Request

- **Non-Fragmented** request (Authenticator) is used to produce either a **Fragmented** or **Non-Fragmented** response.

# Fragment-Inquire

Requesting fragment related parameters from server

Extended-Request

Code	ID	Length
Authenticator		
Type	Len	Value
...		Attributes...

**Code** = Extended-Request ID, Len, **Authenticator** = Same as **Accounting-Request**

**Type** = Fragment-Inquire  
**Value** = 1

**Attributes** = Optional client fragment related parameters communicated to server. To be used only with session based transport.

## Optional Request Attributes

**Fragment-Stream-Limit** Client is capable of receiving response packets up to length indicated

**Fragment-Reply-Supported** Client is capable of receiving fragmented response packets

# Fragment-Inquire

Providing fragment related parameters to client

Extended-Response

Code	ID	Length
Authenticator		
Attributes...		

Code = Extended-Response ID, Len, Authenticator = Same as **Accounting-Response**

## Optional Response Attributes

**Fragment-Reply-Allowed** Server implements Fragment-Reply-Supported attribute (**Section 6.1**)

**Fragment-Stream-Limit** Maximum RADIUS packet length supported by server over TCP

**Fragment-Limit** Maximum fragmented inner packet length supported by server

**Fragment-Inquire-Interval** Interval at which server recommends clients poll for parameter changes

**Framed-MTU** Server MTU hint

**Event-Timestamp** Server time of Extended-Response

# Fragment-Inquire

**Fragment-Reply-Supported** is forwarded toward each downstream destination only if downstream has advertised fragment support via Fragment-Inquire response containing **Fragment-Reply-Allowed**.

RADIUS Server is prevented from generating a fragmented response in the event RADIUS Client or any intermediary (e.g. **Proxy B** in example below) does not support Fragment-Data.

When RADIUS Client and all intermediaries support fragments then **Fragment-Reply-Supported** reaches RADIUS Server. Server may then safely issue a fragmented response.

A large white letter 'Q' is centered inside a dark grey, cloud-like shape with a scalloped edge. The background is a dark teal color with faint, light blue diagonal lines and a larger, lighter blue abstract shape on the right side.

Q

A large white ampersand '&' is centered inside a dark grey, cloud-like shape with a scalloped edge.

&

A large white letter 'A' is centered inside a dark grey, cloud-like shape with a scalloped edge.

A

An orange arrow-shaped label pointing to the right, containing the word 'Question' in white text.

Question

How do you proxy a Extended-Request?

A green arrow-shaped label pointing to the right, containing the word 'Answer' in white text.

Answer

Each “hop” assembles all fragments into an “inner” packet. This packet may then be forwarded by disassembling packet into fragments to next hop.

Q

&

A

Question

Must all systems in proxy chain support Fragments?

Answer

Unfortunately if any system in the chain does not support fragments then RADIUS packets are limited to 4096 bytes.

# Raining on my parade...

Comments, Suggestions and **IDEAS** welcome!!!
