Updating IPv6 Multicast Address Scope 3

draft-droms-6man-multicast-scopes-00

Ralph Droms

rdroms.ietf@gmail.com

Proposed change

OLD:

```
 3 reserved
```

NEW:

```
 3 Network-Specific scope,
   greater than Link-Local
   scope, defined automatically
   from the network topology
```

Summary of discussion

- What's the right word: "network" or "subnet" or "domain" or "???"

- Add some explanatory text making an informative reference to the MPL use case

- Is the definition in the draft sufficiently precise without being overly restrictive?

Open Questions

- Should the document define an IANA registry?
- Is the new definition acceptable?
