

# draft-gellens-ecrit-car- crash

2 November 2013 slides v1

# Purpose of draft

- Describe how IETF mechanisms are used for emergency calls placed by vehicles (Automatic Crash Notification (ACN) and manually triggered)
- ACN is a term for automated vehicle-initiated emergency (interactive) calls with crash data (term is often used to mean both automatically-initiated (e.g., because of crash) and manually-requested)

# Draft Status

- Draft was split off from draft-rosen-ecrit-ecall (which had 11 versions)
- This draft is for ACN systems in general, not eCall

# Need for Draft

- Describes different models in use now and after migration to all-IP
- Describes how such calls are identified and presented to PSAP/ESInet
- Describes how crash data is attached to a call and identified by a PSAP
- Intended to be used by vehicle mfgrs/telematics service providers and NENA for interoperable exchange of crash data

# Proposal

- ECRIT adopt draft as WG draft
