

# OLSRv2: 2004-2014

- Protocol Core + MIBs: 10 specifications

Published: RFC5148, RFC5444, RFC5497, RFC5498, RFC6130, RFC6779  
RFC Ed. Queue: draft-ietf-manet-rfc6622-bis, draft-ietf-manet-olsrv2, draft-ietf-manet-nhdp-olsrv2-sec, draft-ietf-manet-olsrv2-mib

HUGE thanks to all involved over the 10 years:  
Workshops, Interops, Extreme Editing, Design Bashing, ...

The poster features a background image of a long wooden pier extending into the ocean. The text is overlaid on the image. At the top left is the OLSR logo, a stylized sun with rays. The main title 'OLSR Interop & Workshop' is in large, bold, orange letters. Below it, in smaller blue text, is 'in conjunction with the 60th IETF - San Diego, USA' and 'August 6-7, 2004'. A central paragraph in purple and pink text calls for participation, mentioning 'ideas about OLSR?', 'submit a short paper\*', 'OLSR interop (IPv4, IPv6, other)', and 'minOLSR Contest'. At the bottom left, there is a red and green text block about the 'minOLSR Award' and a 'Mailing list' section with contact information for Thomas Heide Clausen.

**OLSR Interop & Workshop**  
in conjunction with the 60th IETF - San Diego, USA  
August 6-7, 2004

Call for participation: You've got fresh or possibly wild **ideas about OLSR?**  
You want to share? Submit a short paper\* for the **OLSR workshop**.  
You've got an **OLSR implementation?** May it be classical or quite special, participate in the **OLSR interop** (IPv4, IPv6, other) and in the **minOLSR Contest**.

**minOLSR Award Ceremony: the smallest working source code implementing OLSR takes home the prize!**

**Mailing list:** Send email to [olsr@ietf.org](mailto:olsr@ietf.org) with "subscribe" in the subject and follow the subsequent instructions.

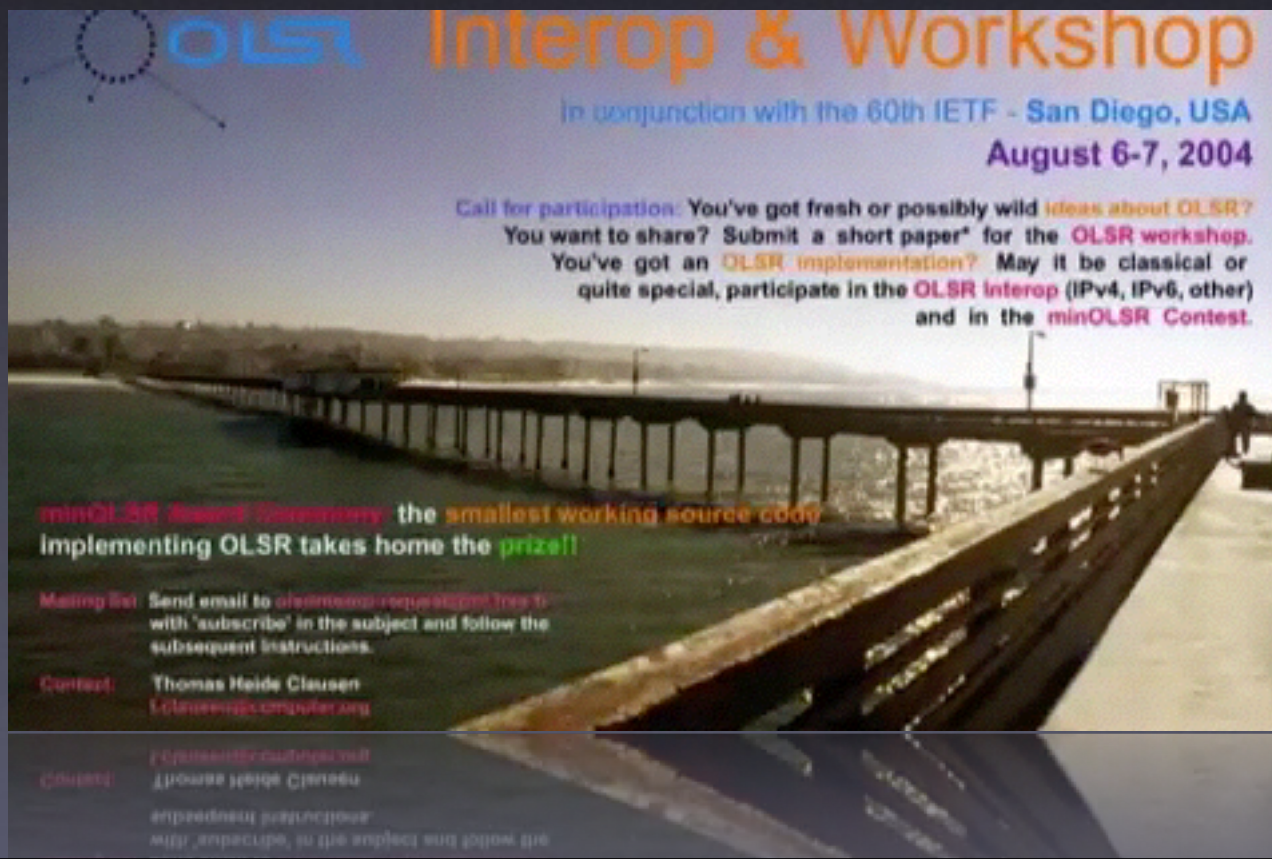

**Contact:** Thomas Heide Clausen  
[thclaus@computer.org](mailto:thclaus@computer.org)

draft-ietf-manet-olsrv2-rmpr-optimization  
draft-ietf-manet-nhdp-olsrv2-tlv-extension

Christopher Dearlove - Thomas Clausen

# draft-ietf-manet-olsrv2-rmpr-optimization Status (2014-03-02)

- On IESG Telechat 2014-02-22 - ballots were:

1 DISCUSS

1 YES

12 NO-OBJECTION

Conflicting use of normative language in Section 4

- New version issued 2014-02-22 (-01)

Addressed all comments - Resolved all DISCUSS

- Current document status:

Sent to RFC Editor. REF dependency on OLSRv2, ...

# draft-ietf-manet-nhdp-olsrv2-tlv-extension

## Status (2014-03-02)

- On IESG Telechat 2014-02-22 - ballots were:

4 DISCUSS

0 YES

9 NO-OBJECTION

- Clarification of IANA considerations:
  - Table description (clear/set bits)
  - Clearer instructions to IANA
- Make more explicit which TLVs can and can't be rejected
- RFC2119 Language Usage

- New version issued 2014-02-24 (-03)

Addressed all comments - Resolved 3 DISCUSSes

- Current document status:

Waiting for final approval that IANA considerations are OK (working with Adrian Farrel, RTG AD, who holds DISCUSS)

IESG Processing Highlights  
(For proceedings, not presentation)

Christopher Dearlove - Thomas Clausen

# draft-ietf-manet-olsrv2-rmpr-optimization

## IESG Processing Highlight

### **Berry Leiba / Pete Resnick (DISCUSS):**

Conflicting use of normative language in section 4:  
These two statements seem in conflict:

```
A set of routing MPRs created as specified in [OLSRv2] MAY be
optimized in the following manner.
```

```
[...]
```

```
It is RECOMMENDED that all OLSRV2 routers use this optimization.
```

The first indicates that the optimization is purely an option. The second indicates that it is a requirement with certain exceptions that may exist. Which do you mean? If the former, I'd suggest just getting rid of both of the 2119 terms (use "can" instead of "MAY" and "suggested" instead of "RECOMMENDED"), since it's only a suggestion. If the latter, change the "MAY" to a "SHOULD".

### **Resolution:**

As there are no "certain expectations" that exist when doing (or not) this, the last sentence has been removed, leaving the "MAY" as appropriate

# draft-ietf-manet-nhdp-olsrv2-tlv-extension

## IESG Processing Highlights

### **Berry Leiba (DISCUSS):**

The descriptions of Tables 4 and 5 have some similar wording, which I can't make sense out of:

```
For all
future allocations, the Expert Review MUST ensure that allocated bits
MUST use the unset bit (0) to indicates no information, so that the
case Value = 0 will always indicate that no information about this
network address is provided.
```

Can you explain what this means, and perhaps come up with clearer wording? I honestly have no idea what you're trying to say, and as it's a "MUST", that seems important.

### **Resolution: (which Berry ultimately suggested):**

```
For each bit in the field, a set bit (1) means that the address has the
designated property, while an unset bit (0) means that no information
about the designated property is provided. For future allocations, the
Designated Expert has to ensure that this sense is preserved, and,
in particular, an unset bit MUST NOT be used to convey any specific
information about the designated property.
```

# draft-ietf-manet-nhdp-olsrv2-tlv-extension

## IESG Processing Highlights

### **Benoit Claise (DISCUSS):**

Very easy-to-fix DISCUSS:

- section 4.1

```
An implementation MUST NOT reject a message because it contains
such a TLV.
```

"such a TLV" is described in the intro text of section 4.1

This sentence is key: this is THE specification, as it contains a MUST, and therefore must be self-contained. Please make clear. For example:

```
An implementation MUST NOT reject a message because it contains
a unrecognized TLV value.
```

### **Resolution:**

Benoit's suggestion folded in.

# draft-ietf-manet-nhdp-olsrv2-tlv-extension

## IESG Processing Highlights

### **Brian Haberman (DISCUSS):**

I have no objection to the publication of this document, but I have two points that need discussing. These should be easily addressed.

1. Section 4 has the following text:

```
This specification describes how NHDP [RFC6130] and OLSRv2
[OLSRv2] SHOULD handle TLVs with other TLV Value fields.
```

I am not sure why there is a "SHOULD" here. \*If\* there was a need for a 2119 keyword, I believe a "MUST" is in order. However, I don't think a 2119 keyword is needed at all. I suggest replacing that sentence with:

```
This specification describes how NHDP [RFC6130] and OLSRv2
[OLSRv2] handle TLVs with other TLV Value fields.
```

### **Resolution:**

Folded in Brian's suggestion

# draft-ietf-manet-nhdp-olsrv2-tlv-extension

## IESG Processing Highlights

### **Brian Haberman (DISCUSS):**

I have no objection to the publication of this document, but I have two points that need discussing. These should be easily addressed.

2. In Section 4.3.1, the text talks about creating an IANA registries to manage the allowed values in the various TLVs. The second paragraph then says

```
An implementation of [RFC6130], receiving a TLV with any TLV
Value other than those values used in that specification, MUST
ignore that TLV Value and any corresponding attribute
association to the address.
```

Shouldn't the guidance be that values not in the \*registry\* are ignored?

### **Rebuttal:**

What's important is that an implementation must ignore any value it doesn't understand. At some future point an extension could add a meaning for a value and have it put in the registry. The existing implementation's requirement is unchanged by that, but is no longer to ignore any value not in the registry. In fact we already have a case that uses that - the UNSPECIFIED values are there to (in effect) be always ignored

### **Resolution:**

An implementation of [RFC6130], receiving a LOCAL\_IF, LINK\_STATUS, or OTHER\_NEIGHB TLV with any TLV Value other than the values which are defined in [RFC6130] MUST ignore that TLV Value, as well as any corresponding attribute association to the address.

# draft-ietf-manet-nhdp-olsrv2-tlv-extension

## IESG Processing Highlights

### Stephen Farrel (Comment) - fixed

Table 4 values 1 and 2 have the same text

### Benoit Claise (Comment) - fixed by removing 2<sup>nd</sup> sentence

This document updates the specification of the protocols [OLSRv2] and [RFC6130]. As such it is applicable to all implementations of these protocols.

What does the second sentence add? Isn't it obvious if this document updates [OLSRv2] and [RFC6130]? Maybe I'm missing a subtle concept?

# NHDP Optimization

Christopher Dearlove

# An NHDP optimization

An Optimization for the MANET Neighborhood Discovery Protocol (NHDP)

draft-dearlove-manet-nhdp-optimization-00

- Note that this is *an* optimization, a small but occasionally useful one.
- It relates to link quality, not link metrics – the latter is an OLSRv2 concept.
- The objective is to reduce disruption when link quality changes, in particular goes down and then back up.
  - Do not have to wait for another router when the cause is local.

# Link quality based link loss

What already happens.

Two routers, A and B. A considers that B is HEARD, or perhaps SYMMETRIC.

A decides that the link quality is too poor to use the link. It marks the link as LOST (with `L_lost = true`).

But A retains knowledge of the link.

This is A's view, dashed = known, unused

# Two-Hop Neighbour

Now suppose that the link was symmetric, as also was a link from B to C.

When A decides that the link from B is no longer of high enough quality, it discards the link between B and C.

This is A's view,  
empty = forgotten

# An optimisation

It would be better if A retained that knowledge:

- If A changes its mind about B, then C is immediately available again.

This is A's new view  
while link to B is poor

And this is what this optimisation does.

# Status of the optimization

This is actually completely legal using NHDP as defined.

- But if you do it in the obvious way (extend 2-Hop Tuples) then you have changed the interface to NHDP as used by, for example, OLSRv2.
- Two options:
  - Do this, but keep details internally hidden.
  - Define this, and how OLSRv2 etc. should now use NHDP.
- Draft does latter, but mentions former.

# One more point

There is one more case that is not mentioned:

What if, in the above case, it is B that decides that the link from A is too poor to use?

This is what results.

Is this a problem for A? No, because if B changes its mind again, then when it re-advertises that it hears A, it will also re-advertise C, and thus A can immediately recover.

# Multi-Topology OLSRv2

Christopher Dearlove

Thomas Clausen

# History

draft--dearlove--manet--olsrv2-multitopology--01

- July 2013.
- Presented at Berlin (IETF 87).

draft--dearlove--manet--olsrv2-multitopology--02

- December 2013.
- Changes described on following slide.

draft-ietf-manet-olsrv2-multitopology-00

- After acceptance as WG draft, February 2014.
- Same as previous draft.
- Aim is Experimental RFC.

# Changes from -01 to -02/-00

Assumes draft-ietf-manet-nhdp-olsrv2-tlv-extension:

- Only IANA and RFC Editor to go.

Completed specification by including:

- Routing MPR willingness per metric/topology.
  - Extended MPR\_WILLING TLV.
- Attached network number of hops per metric/topology.
  - Extended GATEWAY TLV.
- Added IANA Considerations section.
- Editorial changes.

# Still not done

Security considerations

Acknowledgements – we will have some.

# Recap of assumptions

Creates multiple topologies.

Each topology is defined by an OLSRv2 metric.

- No preconfiguration needed to be well-defined.
- Some management needed to work well.

Each topology creates a Routing Set (IP routing table).

Each packet is sent using a single topology end to end.

- Outside scope how, for example DSCP.

Will interwork with unextended OLSRv2.

- Requires draft-ietf-manet-nhdp-olsrv2-tlv-extension.

Topologies need not be complete – by design.

# Plan

Agree technical details.

Complete draft:

- Any required changes (none currently known).
- Missing sections.
- “Wordsmithing”.

Take to Experimental RFC.

- Want implementation(s) to experiment with.

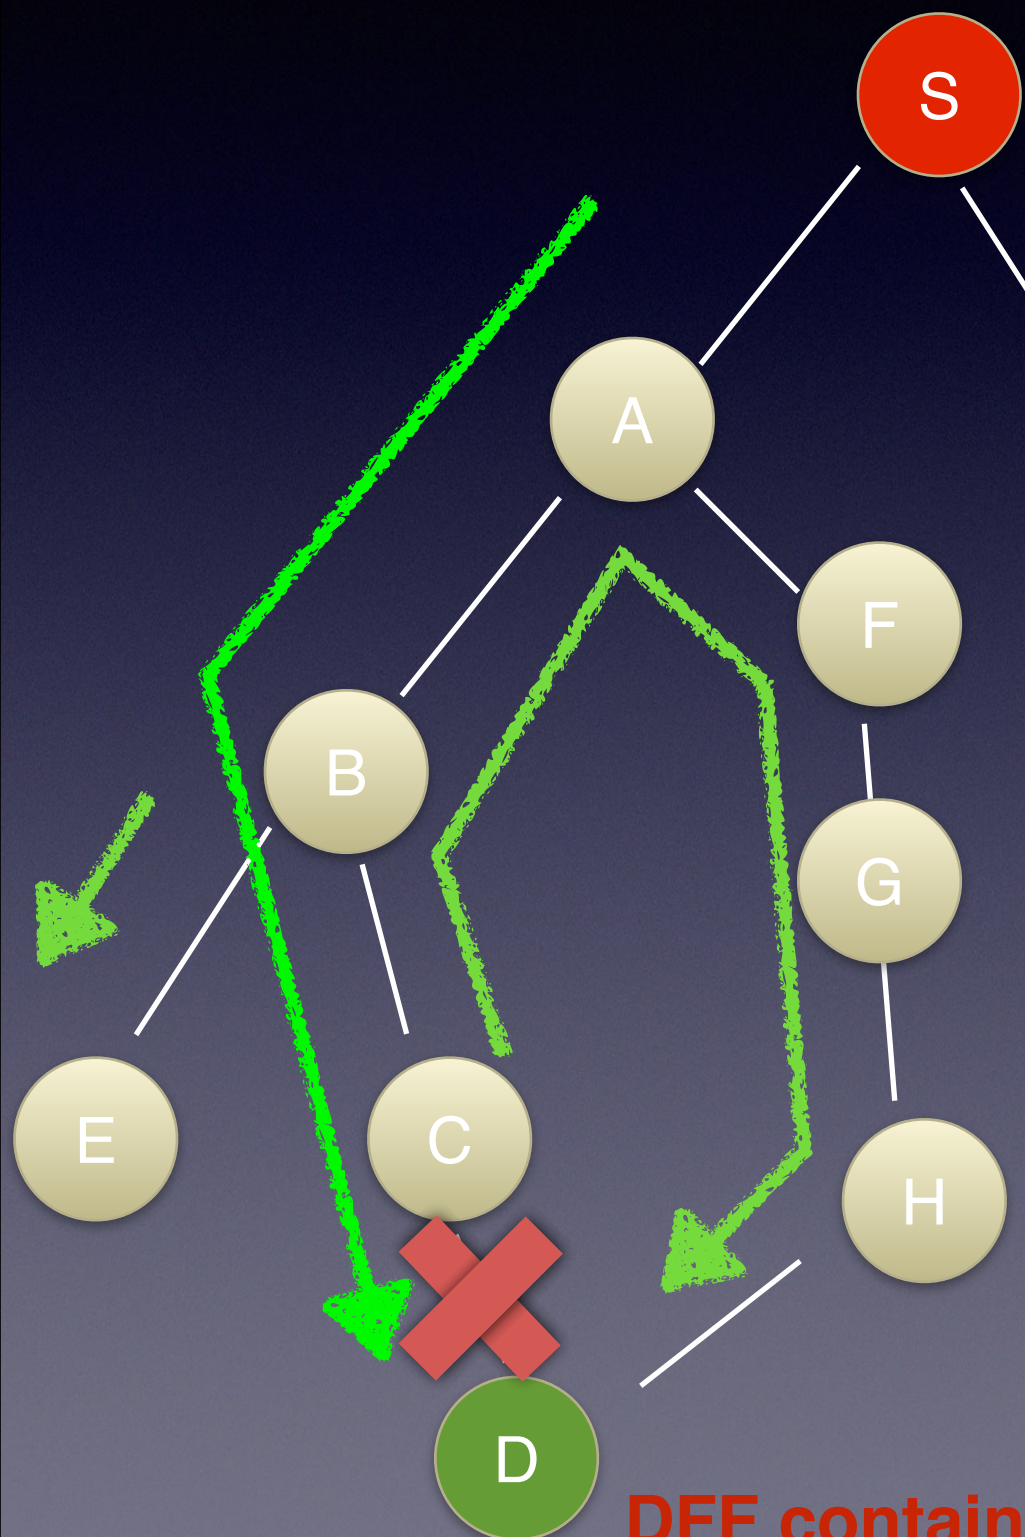

# “Success Before Convergence”

Jiazi Yi - Thomas Clausen

(w/ Ulrich Herberg, Laurent Anadon, Guillaume Pagès, Antonin Bas)

# RFC 6971: Depth-First Forwarding (DFF) in Unreliable Networks

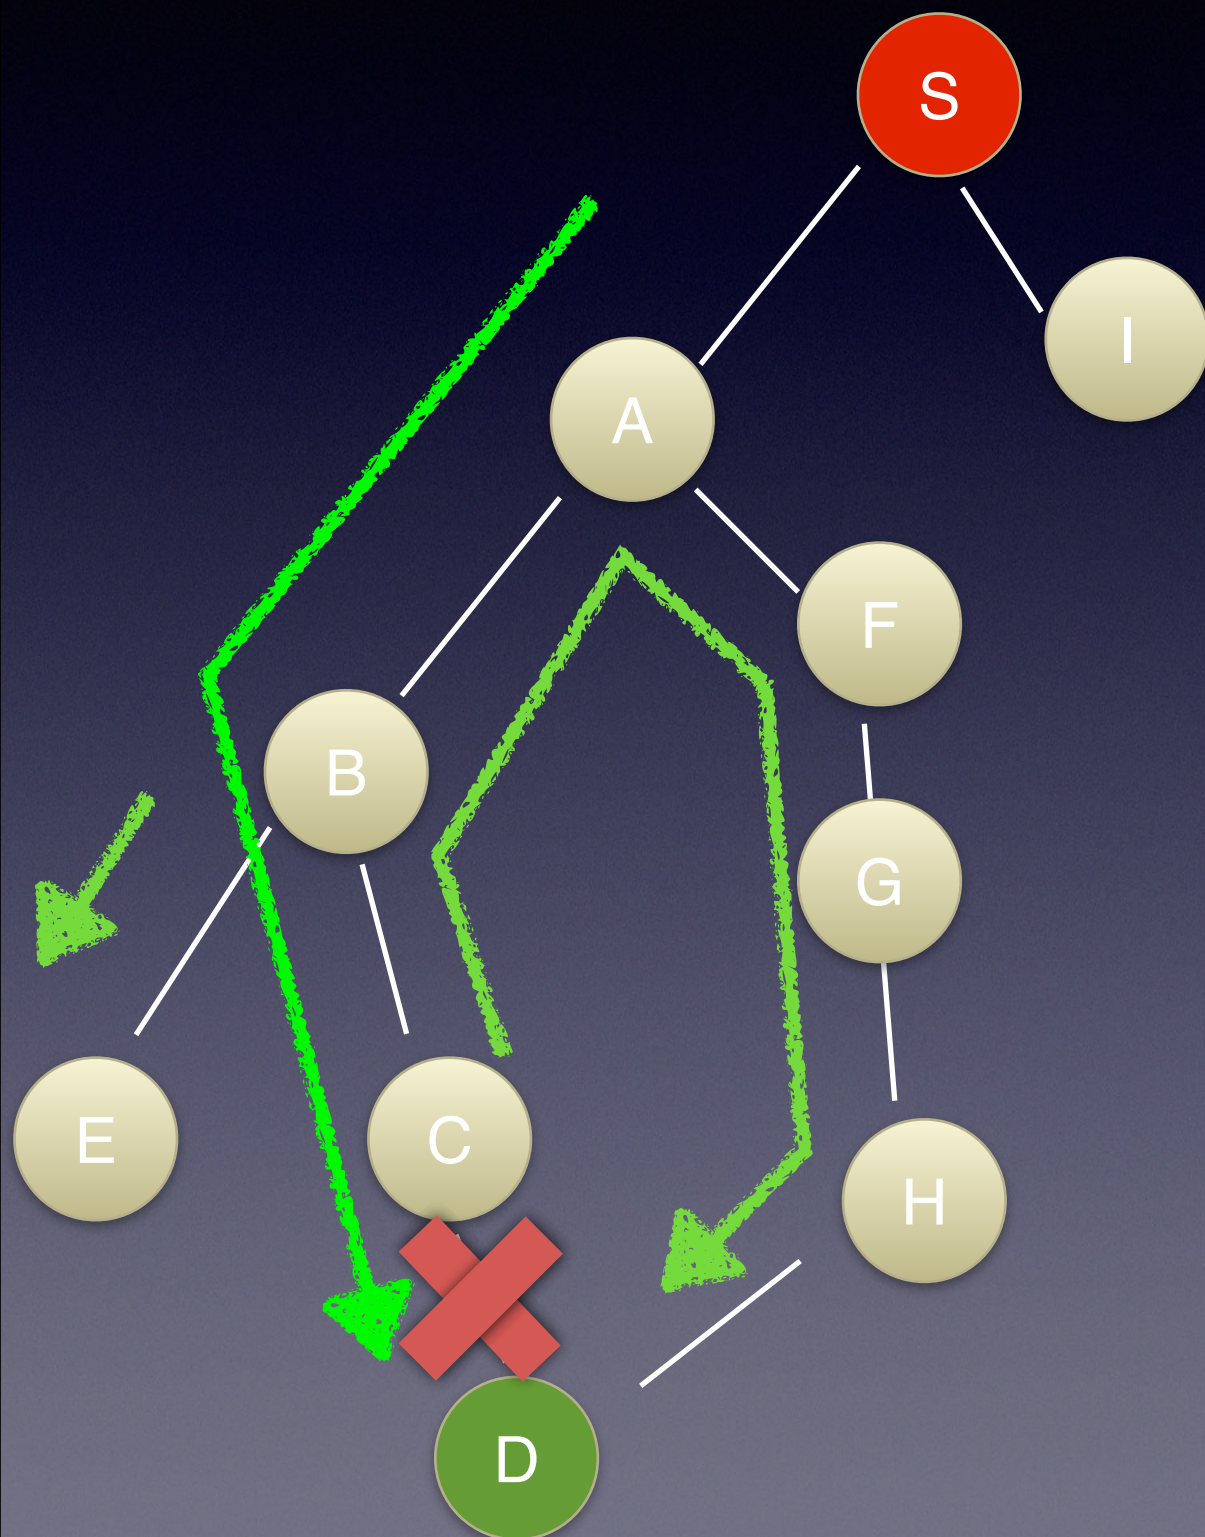

For each packet:

1. Create Candidate Nexthop List (CNL):  
( Next-hop from routing table, {other neighbors}\prev.hop )
2. Forward to first element in CNL
3. Possible outcomes:
  - A. If CNL empty: return packet to prev. hop
  - B. If success (L2-ACK) & neighbour is destination for packet: **stop**
  - C. If failure (no L2-ACK): remove head entry from CNL, resume at 2
  - D. If success (L2-ACK) & neighbour is not destination for packet & packet returned by neighbor: remove head entry from CNL, resume at 2
  - E. If success (L2-ACK) & neighbour is not destination for packet, that neighbour will execute this procedure, starting at 1

**DFF contains loop-detection mechanisms - read RFC for details**

# “DFF++”

- Add *transient* routing table (“learn from past failed delivery attempts”)
  - For each forwarded packet, record destination, neighbours tried
  - Use this for when ordering CNL
- Reflected by 1 element in DFF loop detection tuple + ordering constraint

# DFF/DFF++ Reactive Protocols

- Additional neighbourhood discovery mechanisms required, like NHDP
- CNL: RT + (unsorted) neighbour set
- On data packet forwarding failure, DFF is triggered (in addition to route error/repair)
- Results presented here: fixed density network, highly lossy links: for each packet, 20% loss probability

# Reactive Protocol Data Delivery Ratio

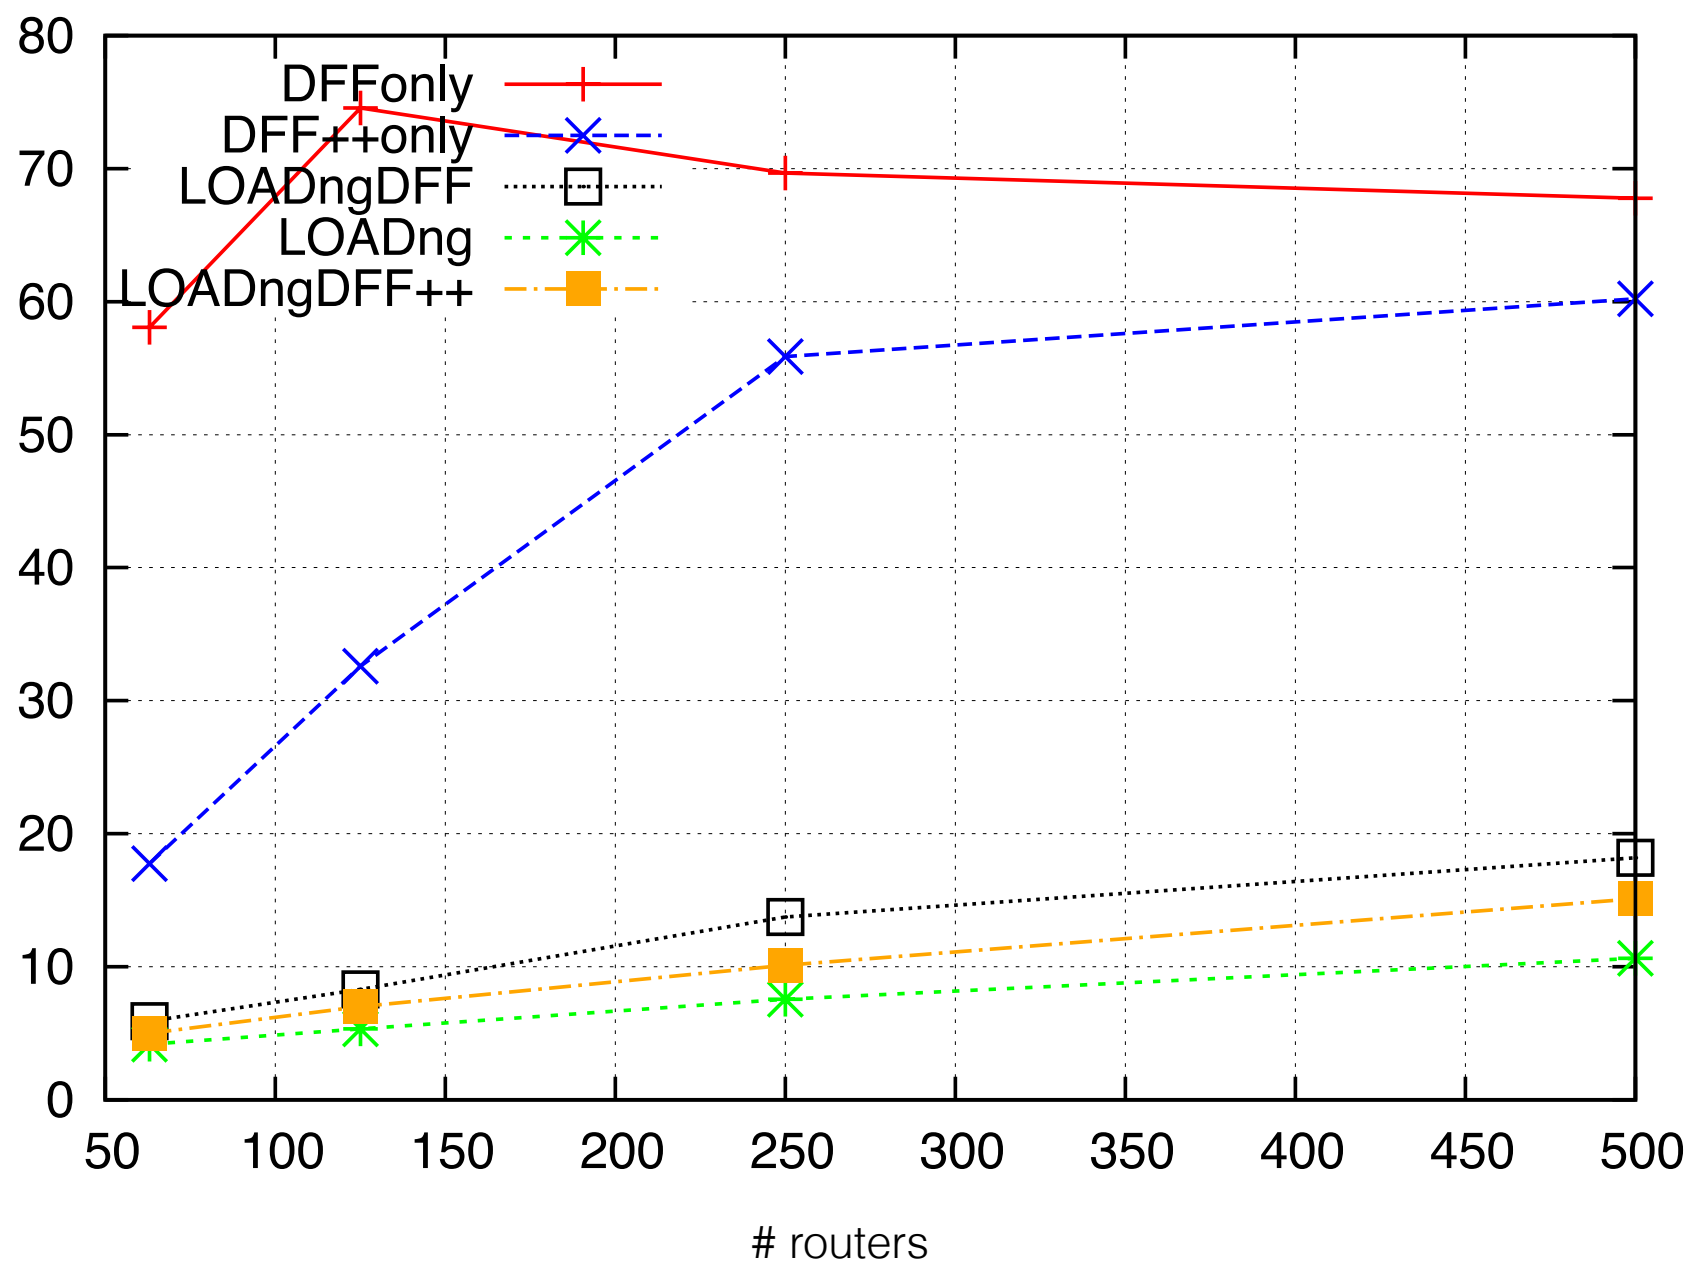

# Reactive Protocol Data Delivery Delay (sec)

# Reactive Protocol Path Length (hops)

# Reactive Protocol Ctrl Traffic Overhead (bytes/s)

# DFF/DFF++

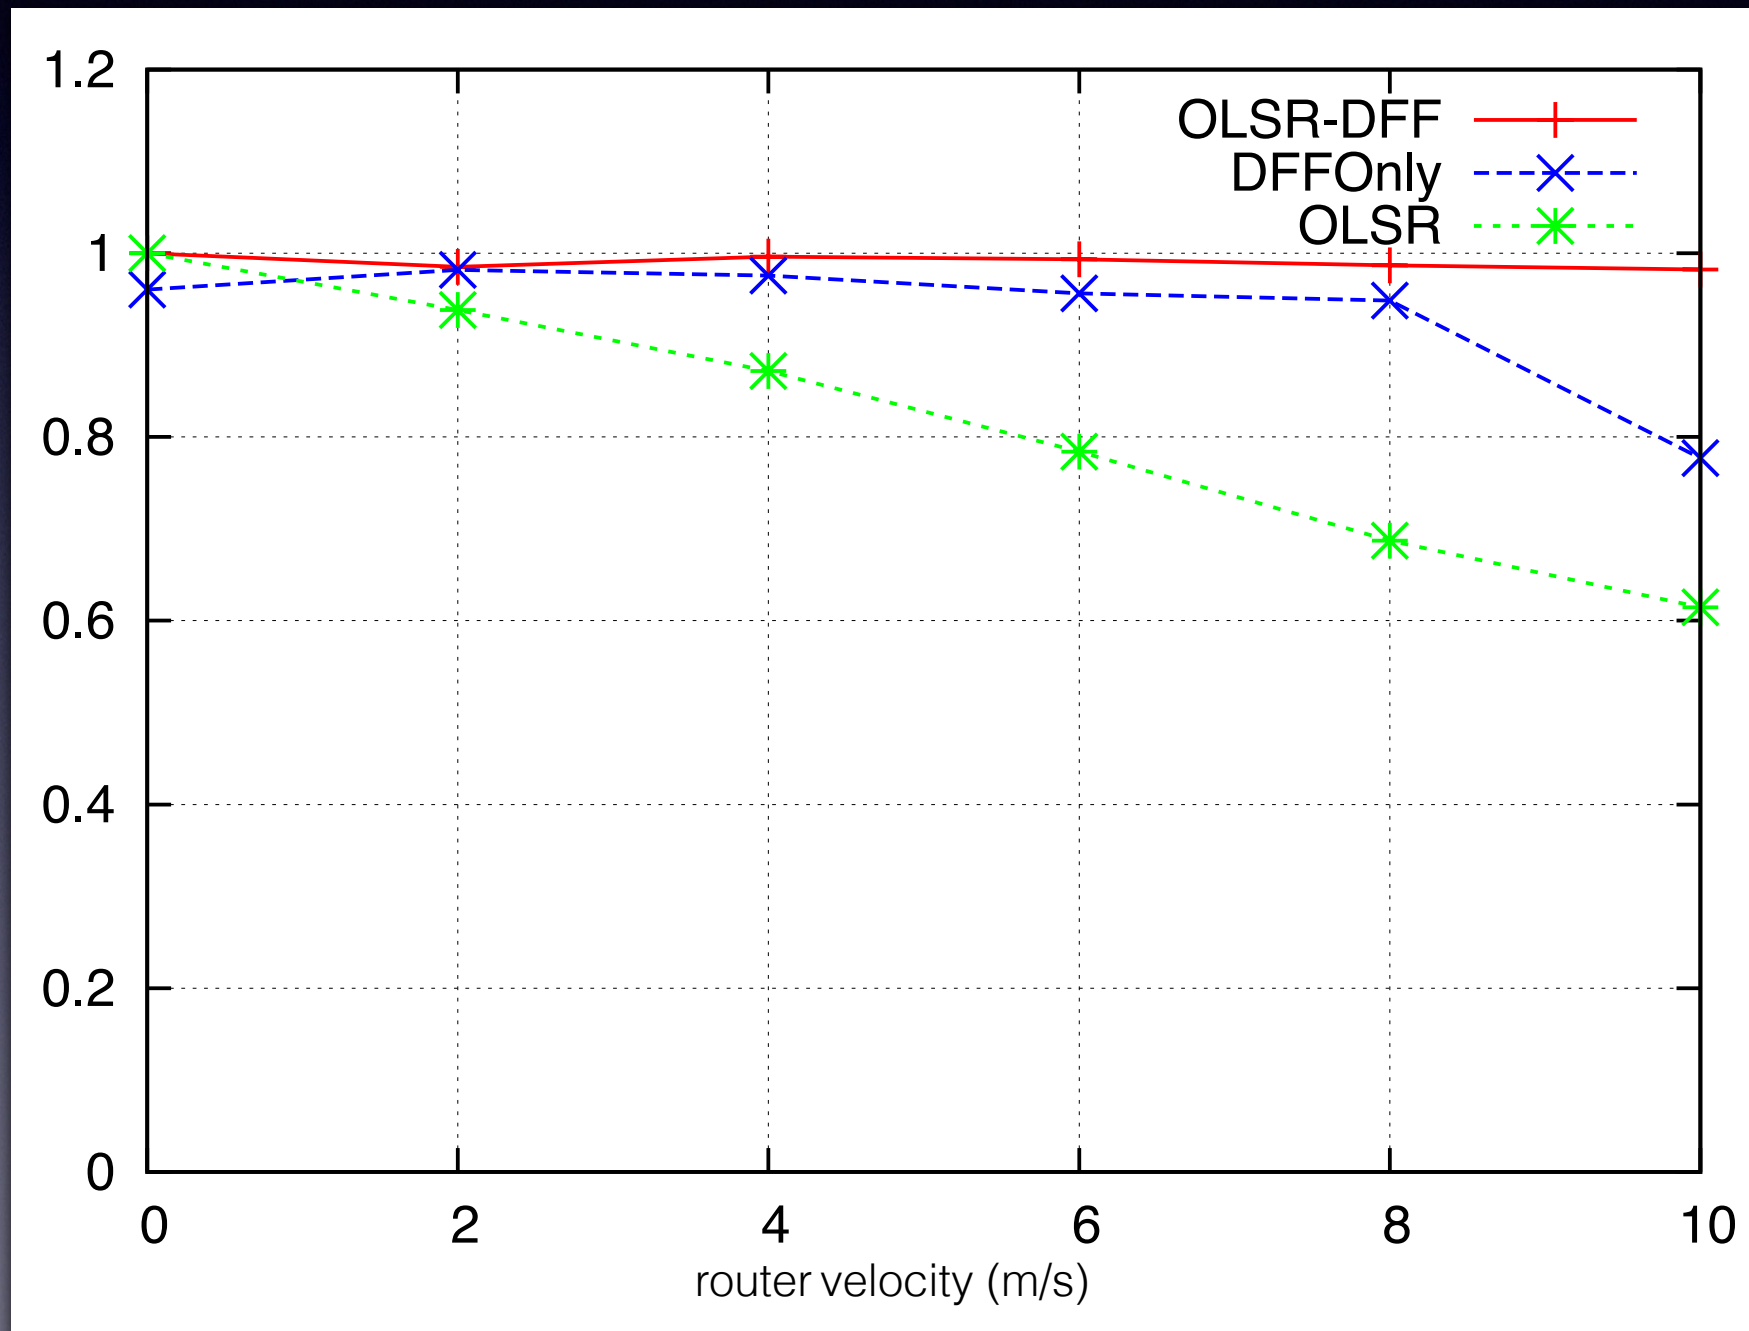

## Proactive Protocols (OLSRv2)

- NHDP already present
- CNL: RT + (unsorted) neighbour set
  - Note: could do better heuristics, e.g., remove next-hop from topology graph, rerun dijkstra, alas, computational cost
- On data packet forwarding failure, DFF is triggered (no triggered route repair in OLSRv2)
- Results presented here: 50 nodes in 1000\*1000 grid, varying mobility  
*“Success before convergence”*

# OLSRv2

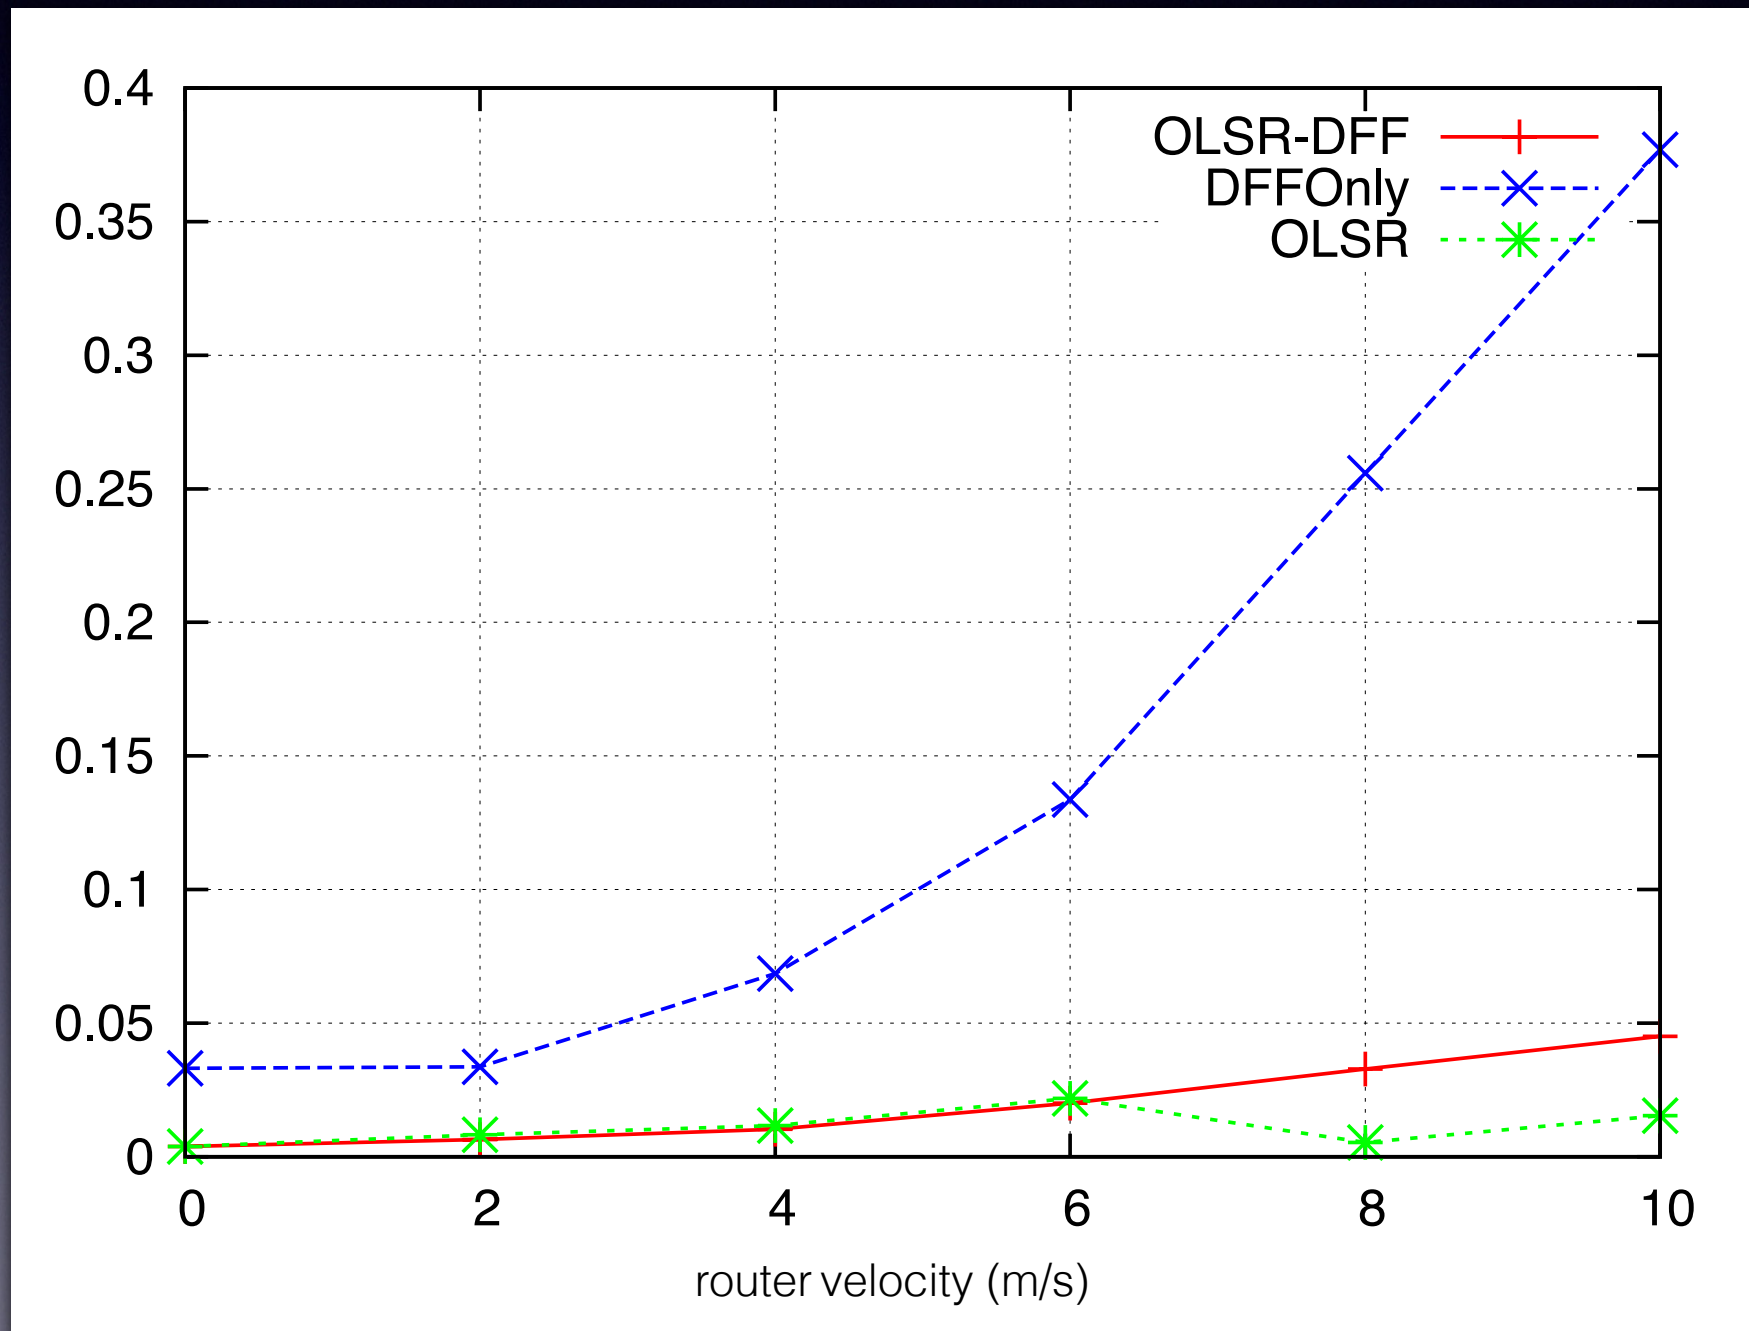

## Data Delivery Ratio

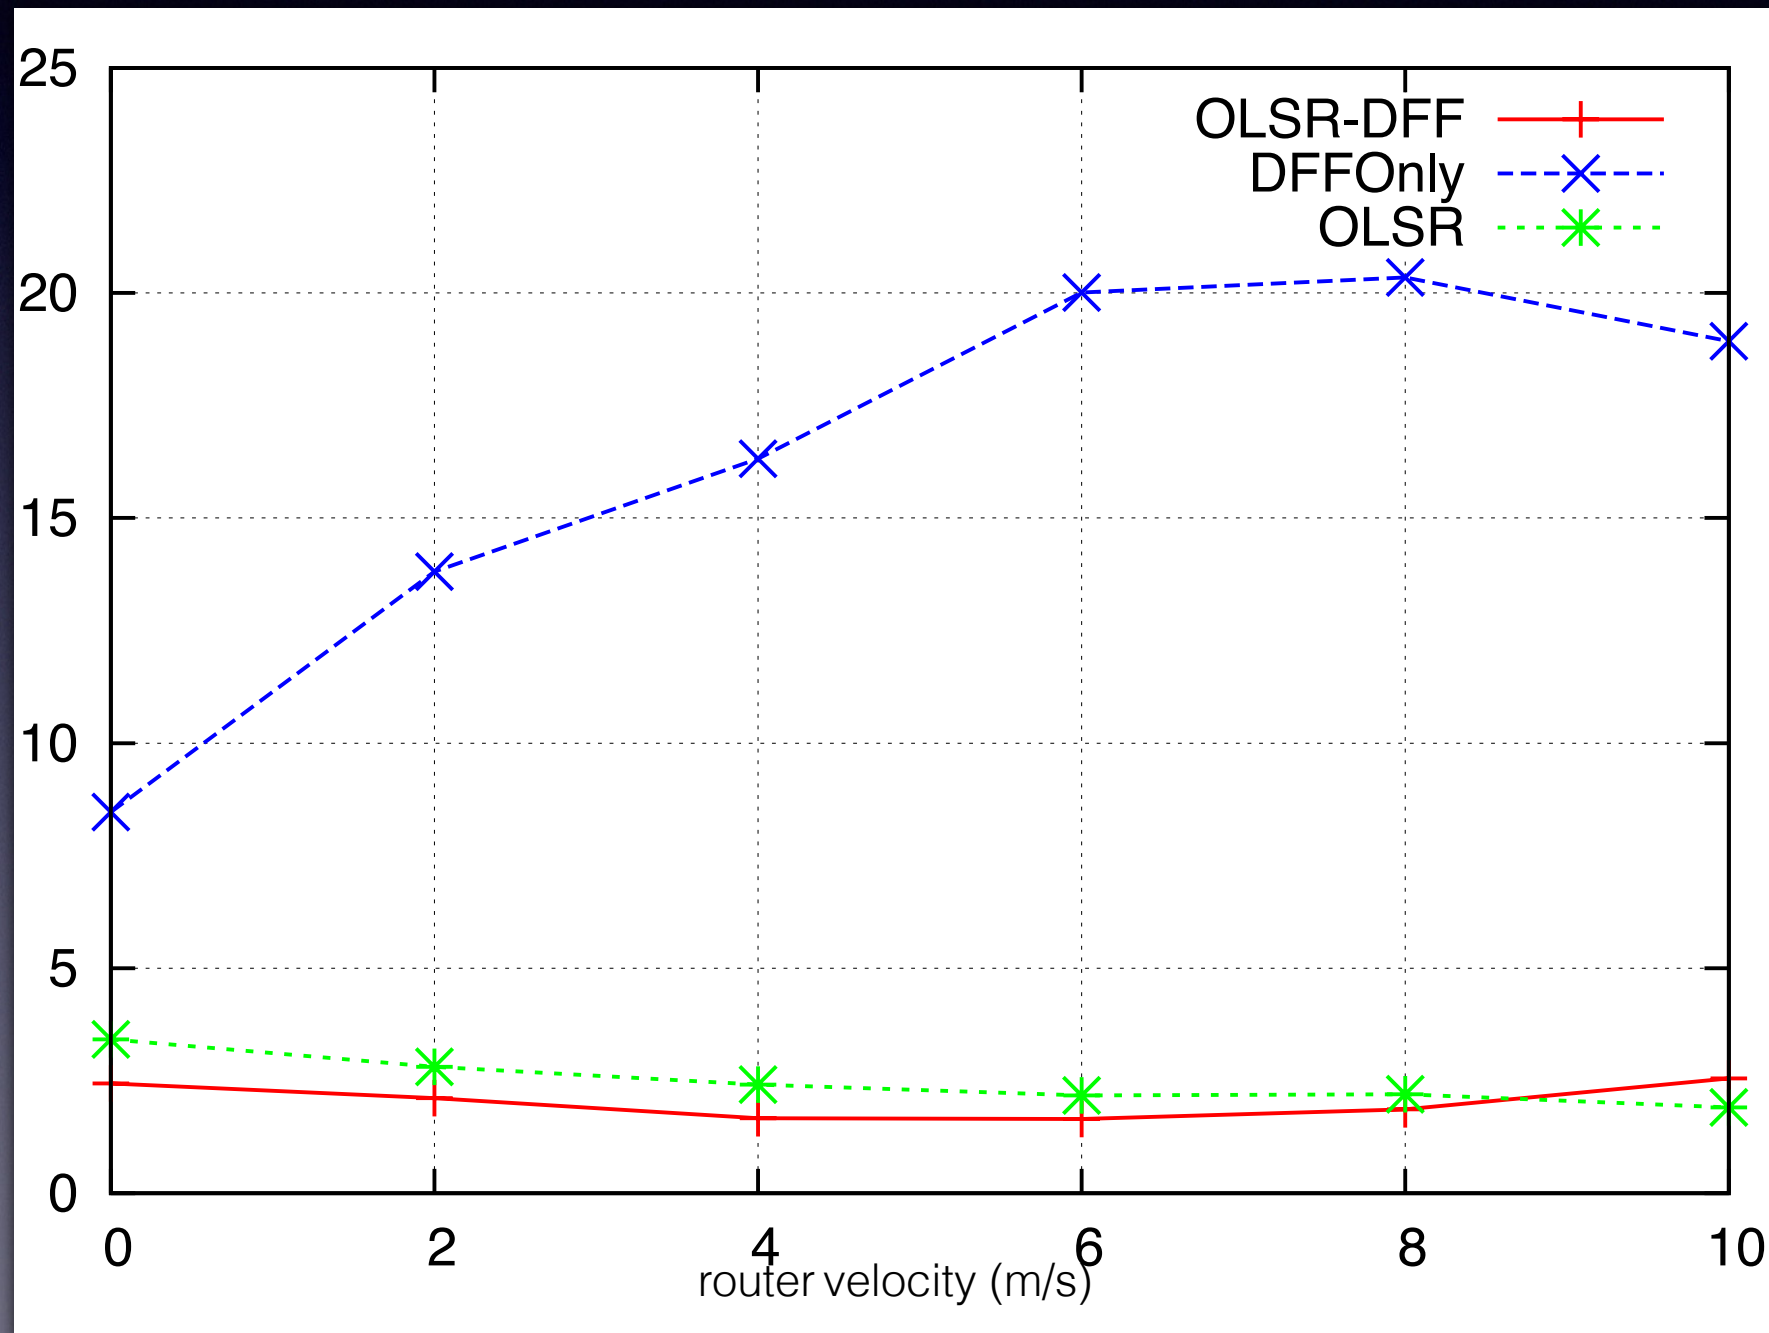

# OLSRv2

## Data Delivery Delay (sec)

# OLSRv2

## Path Length (hops)

# Concluding Remarks

- Point the WG to potential gains from RFC6971
- Complementary to routing: *“Success before convergence”*
- Encourage more experimental data on this front
- Not recommending any WG action at this juncture
- Additional “tricks”, such as DFF++, CNL heuristics possible - could eventually lead to WG actions

## **“A Depth First Forwarding (DFF) Extension for the LOADng Routing Protocol”**

Sixth International Workshop on Autonomous Self-Organizing Networks

Thomas Clausen, Jiazi Yi, Antonin Bas, Ulrich Herberg

## **“Depth First Forwarding for Low Power and Lossy Networks: Application and Extension”**

IEEE World Forum on Internet of Things WF-IoT 2014 (Accepted)

Jiazi Yi, Thomas Clausen, Ulrich Herberg
