Discussion points & notes

- Issues in trac
 - [\[trac#1\]](#) Options for avoiding logging private subdomains
 - [\[trac#2\]](#) Require log submitters to verify SCTs
 - [\[trac#3\]](#) TLS clients should audit
 - [\[trac#4\]](#) Should we sign TBH for certs
 - [\[trac#5\]](#) Add extensions to STH
 - [\[trac#6\]](#) Should we flatten the MerkleTreeLeaf structure ?
 - [\[trac#7\]](#) Clarify error messages from logs
 - [\[trac#8\]](#) Need a way to obtain Merkle proofs for a batch of certs around SCT timestamp
- Gossip
- Embedding Inclusion Proof in TLS/OCSP
- Timelines: WG Final Call vs Chrome Deadlines
- Privacy preserving inclusion proof lookups

[[trac#1](#)] Options for avoiding logging private subdomains

Rob Stradling's proposal:

1. Allow name-constrained intermediate cert logged in place of EE:
 - a. NC must include 1+ permitted domain names (no TLDs or public suffix)
 - b. Intermediate has flag explicitly permitting it to be logged in place of EE

2. Allow masking of private subdomains in PreCert:
 - a. Precert has `SAN:dNSName="<PRIVATE>".customer.com`
 - b. EE has:
 - i. `SAN:dNSName=top.secret.customer.com`
 - ii. an INT for each CN & SAN which specifies how many left-most domain components are masked

[[trac#1](#)] Options for avoiding logging private subdomains

- Bonus: Allows CT TLS clients to perform the same checks for "overly-broad" EE wildcard certs to the NC of issuing certs.
 - e.g NC=<PRIVATE>.co.uk issues top.secret.blah.co.uk may be rejected by clients.
- Though the log probably shouldn't enforce client policy.

EE SAN	CT Log sees	TLS client w/o CT sees	TLS client w CT sees
*.co.uk	*.co.uk	*.co.uk (rej)	*.co.uk (rej)
top.secret.co.uk	<PRIVATE>.co.uk	top.secret.co.uk (accept)	<PRIVATE>.co.uk (rej)

Gossip

Goal: Detect forked/split-world logs

Mechanism:

- Gossip STHs between CT aware parties to detect inconsistency
 - Between TLS Client & Server
 - With Logs (about other logs)
- TLS Servers could maintain a pool of STHs sent by clients and pass a fraction of them out at random during responses

Embedding Inclusion Proof in TLS/OCSP

- Transforms potentially privacy-eroding inclusion proof query into a simple tree consistency proof request.
- Optional - has page-load-latency/size impact & 10 year roll out.

Timelines: WG Final Call vs Chrome Deadlines

Privacy preserving inclusion proof lookups

- DNS query mechanism
- Batch queries around SCT Timestamp
 - Risks when log is/was not accepting many certs at the time
