draft-ietf-ecrit-car-crash-00

IETF 90 ecrit WG — 14 July 2014
slides v1 — 23 July 2014

Purpose of draft (1)

- Describe how IETF mechanisms are used for emergency calls placed by vehicles

  - Automatic Crash Notification (ACN), includes manually triggered

- ACN is a term for vehicle-initiated emergency (interactive) calls with crash data

  - term is often used to mean both automatically-initiated (e.g., because of crash) and manually-requested

Purpose for Draft (2)

- Describes different models in use now and after migration to Next-Generation (all-IP)

- Describes how such calls are identified and presented to PSAP/ESInet

- Describes how crash data is attached to a call and identified by a PSAP

- Intended to be used by vehicle mfgrs/telematics service providers and NENA for interoperable exchange of crash data

Draft Status

- Draft was split off from draft-rosen-ecrit-ecall (which had 11 versions)

- Fourth revision since split

- This draft is for ACN in general, not eCall
