WEIRDS interop report

IETF 90, Toronto
WEIRDS
2014-07-23

{guillaume.leclanche, jean-francois.tremblay, marc.blanchet}
@viagenie.ca

Attendance

- 5 servers
  - 2 number servers
  - 1 name servers
  - 2 number+name server
- 1 test suite (acting as a client) targeting servers
  - 100 test cases

What's new in the test suite

- Bug Fixes

- Prepared a website:

  - Implementers will be able to run the tests themselves

  - Not ready completely yet !

- General improvement of the previous tests and core logic

Interop results

- "Issues" in implementations have already been all seen before
  - Java Web framework bug
  - Dealing with invalid input data: 404 or 400 ?
    - Frameworks may generate the code before rdap server code kicks in
  - HTML answer instead of JSON for errors
  - Incomplete search implementations, or returning too many results

- Implementations are converging => Good !

Questions raised

- How should a client interpret the answer from the server, how should it react to the various response codes ?

    – Need a document for this ?

Next steps

- Do it again at IETF 91 in Honolulu?

- If Yes: Talk to us to join the next interop if you want to participate !
