# BGP Extensions for BIER draft-xu-idr-bier-extensions-01

Xiaohu Xu (Huawei)

**Mach Chen (Huawei)** 

**Keyur Patel (Cisco)** 

**IJsbrand Wijnands (Cisco)** 

**Tony Przygienda (Ericsson)** 

IETF92, Dallas

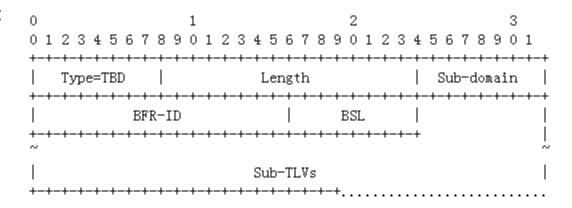

#### **Motivation**

- Bit Index Explicit Replication (BIER) is applicable in multi-tenant data center network environments for efficient delivery of BUM traffic while eliminating the need for maintaining multicast states in the underlay[I-D.kumar-bier-use-cases].
- BGP instead of IGP is used as an underlay in some large multi-tenant data center network environments [I-D.ietf-rtgwg-bgp-routing-large-dc].
- This document describes BGP extensions for advertising the BIER-specific information.
  - A new optional, transitive path attribute, referred to as the BIER attribute, can be attached to a BGP UPDATE message by the originator so as to indicate the BIER-specific information of a particular BFR which is identified by the /32 or /128 address prefix contained in the NLRI.

#### **BIER Path Attribute**

■ The attribute type code for the BIER Attribute is TBD. The value field of the BIER Attribute contains one or more BIER TLV as shown

below:

■ MPLS-BIER Encapsulation sub-TLV is a sub-TLV of the BIER TLV encoding the MPLS-BIER specific information.

| 0  |         | 1        |        |        | 2         |           | 3         |
|--|---------|----------|--------|--------|-----------|-----------|-----------|
| 0 1                                      | 2 3 4 5 | 67890    | 1234   | 5 6 7  | 8 9 0 1 2 | 3 4 5 6 7 | 78901     |
| +-+-                                     | -+-+-+- | -+-+-+-+ | +-+-+- | -+-+-+ | -+-+-+-+  | -+-+-+-   | +-+-+-+-+ |
| Type=TBD   Length=7                      |         |          |        |        |           | Lbl Ra    | ange Size |
| +- |         |          |        |        |           |           |           |
| Label Range Base                         |         |          |        |        |           |           |           |
| +- |         |          |        |        |           |           |           |

## **Originating BIER Attribute**

- An implementation that supports the BIER attribute MUST support a policy to enable or disable the creation of the BIER attribute and its attachment to specific BGP routes.
- An implementation MAY disable the creation of the BIER attribute unless explicitly configured to do so otherwise.
- A BGP speaker MUST only attach the locally created BIER attribute to a BGP UPDATE message in which at least one of its routable addresses (e.g., a loopback address) is contained in the NLRI.
  - **The routable address contained in the NLRI is RECOMMENDED to be the one used for establishing BGP sessions.**

## Restrictions on Sending/Receiving

- An implementation that supports the BIER attribute MUST support a per-EBGP-session policy, that indicates whether the attribute is enabled or disabled for use on that session.
- The BIER attribute MUST NOT be sent on any EBGP peers for which the session policy is not configured.
  - If an BIER attribute is received on a BGP session for which session policy is not configured, then the received attribute MUST be treated exactly as if it were an unrecognised non-transitive attribute. That is, "it MUST be quietly ignored and not passed along to other BGP peers".
- To prevent the BIER attribute from "leaking out" of an BIER domain, each BGP router on the BIER domain MUST support an outbound route announcement policy. Such a policy MUST be disabled on each EBGP session by default unless explicitly configured.

## **Deployment Considerations**

- It's assumed by this document that the BIER domain is aligned with the Administrative Domain (AD) which are composed of multiple ASes (either private or public ASes).
  - Use of the BIER attribute in other scenarios is outside the scope of this document.
- Since the BIER attribute is an optional, transitive path attribute, a non-BFR BGP speakers could still advertise the received route with a BIER attribute.
  - This is desirable in the incremental deployment scenario where a BGP speaker could tunnel a BIER packet or the payload of a BIER packet to a BFER directly if the BGP next-hop of the route for that BFER is a non-BFR.
- A BGP speaker is allowed to tunnel a BIER packet to the BGP next-hop if these two BFR-capable BGP neighbors are not directly connected (e.g., multi-hop EBGP).

## **Next Steps**

**Comments?**
