

# Sender Constrained JWT for OAuth 2.0

-- <https://www.ietf.org/id/draft-sakimura-oauth-rjwtprof-05.txt>

Nat Sakimura  
Kepeng Li

# Background

- ▶ OAuth PoP Security Architecture talks about
  - Security threats
    - Token manufacture/modification
    - Token disclosure
    - Token redirect
    - Token reuse
  - Possible ways to alleviate security threats
    - Confidentiality protection
    - Sender Constraint ← Not written in POP Key Semantics.
    - Key confirmation
- ▶ Client Authentication @ Resource Server out of scope of POP Key Semantics.
  - But, we need it, do not we?

This draft was first written as the response to the WGLC for POP Key Semantics.

## 4. Sender Constraint Representation

- ▶ Include Client ID in the JWT payload

- ▶ Example:

```
{  
  "iss": "https://server.example.com",  
  "sub": "joe@example.com",  
  "azp": "https://client.example.org",  
  "aud": "https://resource.example.org",  
  "exp": "1361398824",  
  "nbf": "1360189224",  
}
```

- ▶ Note that RS MUST authenticate the Client.

# 5. Client Authentication

1. The authorized presenter issues a HEAD or GET request to the resource server.

```
GET /resource/1234 HTTP/1.0  
Host: server.example.com
```

2. The resource server returns a HTTP 401 response with WWW-Authenticate header with "Named" scheme, which includes nonce.

```
HTTP/1.0 401 Unauthorized  
Server: HTTPd/0.9  
Date: Wed, 14 March 2015 09:26:53 GMT  
WWW-Authenticate: Named nonce="dcd98b7102dd2f0e8b11d0f600bfb0c093"
```

3. The client creates JWS compact serialization over the nonce.
4. The client sends the request to the resource server, this time with Authorization: header with Named scheme and access token and the JWS.

```
GET /resource/1234 HTTP/1.0  
Host: server.example.com  
Authorization: Named at="access.token.jwt", s="jws.of.nonce"
```

# 6. Finding Client Key

## ▶ 6.1. URI client ID

- When the Client ID is a URI, then the key can be found from the .well-known/jwk URI.

## ▶ 6.2. pre-shared key tables

- Alternatively, the collection of the keys can be pre-shared among the participants in advance as a key table that lists the client ID - public key pair.

## ▶ 6.3. Via client metadata API of the authorization server

- Client Metadata can be exposed through a client metadata API at the Authorization Server, which can be defined by the authorization server in a way similar to OAuth 2.0 Token Introspection.

# Questions

Should we merge into

▶ PoP Security Architecture draft?

- <https://www.ietf.org/id/draft-ietf-oauth-pop-architecture-02.txt>

▶ Or to Proof-of-Possession Key Semantics for JSON Web Tokens (JWTs)?

- <https://tools.ietf.org/html/draft-ietf-oauth-proof-of-possession-03>

Or proceed as a separate document?

Or is it a bad idea that we should throw it away?
