

# **A General Mechanism for RTP Header Extensions: draft-ietf-avtcore-rfc5285-bis-01**

**Roni Even**

**Dave Singer**

**Harikishan Desineni**

# Changes from last IETF meeting

- Working group document.
- Clarify the usage of RTP header extensions
  - Header extensions may be important for interoperability and intermediaries should not remove them.
- Add text to security section to reference RFC6904.

# Changes from RFC5285

- Major change – allow mixing of single byte and double bytes RTP headers in the same RTP stream
  - Define SDP attribute allowing negotiation of this mode for backward interoperability with RFC5285.

# Next steps

- Address comments from Colin, mostly editorial.
- Clarify text in section 4.1 addressing implication on RTP Header compression.
  - Explain the issue with the X bit that may toggle instead of being “Rarely changed” as specified in RFC5225.
- New version after the meeting will be ready for WGLC
