Token Binding over HTTPS

Update for IETF 96

Berlin · 07/19/2016
Dirk Balfanz & Vinod Anupam

Changes since last meeting

- Clarification on how many provided and referred bindings can occur (especially during redirects)
- Enshrined eTLD+1 as key scope granularity
- New response header name for federation: Include-Refer**red**-Token-Binding-ID
- Wordsmithing, acknowledgments, etc.

- [here is the diff](#).

Demo!

Token Binding and fetch()

- Fetch spec by WHATWG unifies how Web clients fetch resources

- Started conversation with WHATWG
- Created Pull Request to incorporate Token Binding into fetch()
- Proposed changes in
  - Basic browser flow - for first-party Token Binding
  - Redirect flow - for redirect-based federation
  - Programmatic fetch() - for programmatic federation (still a layer below API surface)
- Responding to editor comments
