Requirements for new work on fragments in 6lo (mesh) networks

P.Thubert

IETF 99

Prague

History

- Presented 6lo Fragmentation issues in Chicago
 - In appendix of this slideware
 - Mostly issues for route-over
 - Summarized in next slide

- Work on fragmentation at LPWAN
 - As part of the SCHC IP/UDP draft
 - Optional: Windowing/individual retry of fragments
 - Does not need to support multihop

Context

- TCP rarely used,
 - Pro is MSS to avoid fragmentation
- 6LoWPAN applications handle their reliability
 - UDP
 - to get exactly what they need
 - They also expect very long round trips.
- Time gained by streamlining fragments is available for retries without a change in the application behavior.

6lo Route-Over fragmentation issues

- Recomposition at every L3 hop
 - Cause latency and buffer overutilization
- Uncontrolled sending of multiple fragments
 - Interferences in single frequency meshes
- Fragment flows interfere with one another
 - Buffer bloat / congestion loss
- Loss locks buffers on receiver till time out
 - Readily observable, led to RFC 7388

6lo Fragmentation reqs

- Provide Fragment Forwarding
 - There are pitfalls, better specify one method
 - E.g. datagram tag switching ala MPLS
 - Stateful => state maintenance protocol
- Provide pacing/windowing capabilities
 - Mesh awareness? (propagation delay, nb hops)
- Provide fragment reliability
 - individual ack/retry/reset, e.g. ala SCHC
- Provide congestion control for multihop
 - E.g. ECN

Path Forward

- Solutions exist (as shown by draft-thubert..):
- 1. Produce a problem statement at 6lo
 - Based on this slideware
- 2. Form a design team
 - Need TSV skills to solve the problem
 - Also MPLS and radio skill, CoAP, CoCoA
- 3. Find a host WG and produce a std track
 - at TSVWG?
- 4. Also recommendations for application design

Recomposition at every hop

- Basic implementation of RFC 4944 would cause reassembly at every L3 hop
- In a RPL / 6TiSCH network that's every radio hop
- In certain cases, this blocks most (all?) of the buffers
 - Buffer bloat
- And augments latency dramatically

Research was conducted to forward fragments at L3.

Early fragment forwarding issues #1

- Debugging issues due to Fragments led to RFC 7388
- Only one full packet buffer
- Blocked while timing out lost fragments
- Dropping all packets in the meantime
- Arguably there could be implementation tradeoffs
 - but there is no good solution with RFC4944,
 - either you have short time outs and clean up too early,
 - or you lose small packets in meantime

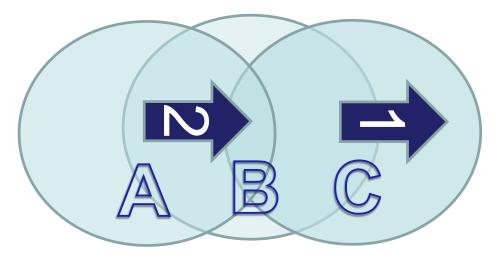

Early fragment forwarding issues #1 c'd

- Need either to abandon fragmented packet
- or discover loss and retry quickly, both need signaling
- Solution is well-know:
 - selective acknowledgement
 - reset
- Requires new signaling

=> Implementation recommendations are not sufficient

Early fragment forwarding issues #2

- On a single channel multihop network (not 6TiSCH):
 Next Fragment interferes with previous fragment
- No end-to-end feedback loop
- Blind throttling can help
- New signaling can be better

Deeper fragment forwarding issues #3

- More Fragments pending than hops causes bloat
- No end-to-end feedback loop for pacing
- Best can do is (again) blind throttling
- Solution is well-known, called dynamic windowing
- Need new signaling

=> Implementation recommendations are not sufficient

Deeper fragment forwarding issues #4

- Multiple flows through intermediate router cause congestions
- No end-to-end feedback for Congestion Notification.
- Blind throttling doesn't even help there
- Fragments are destroyed, end points time out, packets are retried, throughput plummets
- Solution is well-known, called ECN
- Need new signaling

=> Implementation recommendations are not sufficient

Deeper fragment forwarding issues #5

- Route over => Reassembly at every hop creates a moving blob per packet
- Changes the statistics of congestion in the network
- Augments the latency by preventing streamlining
- More in next slides

=> Need to forward fragments even in route over case

Current behaviour

	Sender	Router 1	Router 2	Receiver
T=0	III			
T=1	II(I)	I		
T=2	I(I)			
T=3	(I)			
T=4		II(I)	I	
T=5		I(I)	II	
T=6		(I)		
T=7			II(I)	I
T=8			I(I)	II
T=9			(I)	III

Window of 1 fragment

	Sender	Router 1	Router 2	Receiver
T=0	Ш			
T=1	II(I)	I		
T=2	II	(I)	I	
T=3	II		(I)	1
T=4	I(I)	Ī		1
T=5	1	(I)	I	1
T=6	I		(I)	II
T=7	(1)	I		II
T=8		(I)	1	II
T=9			(I)	III

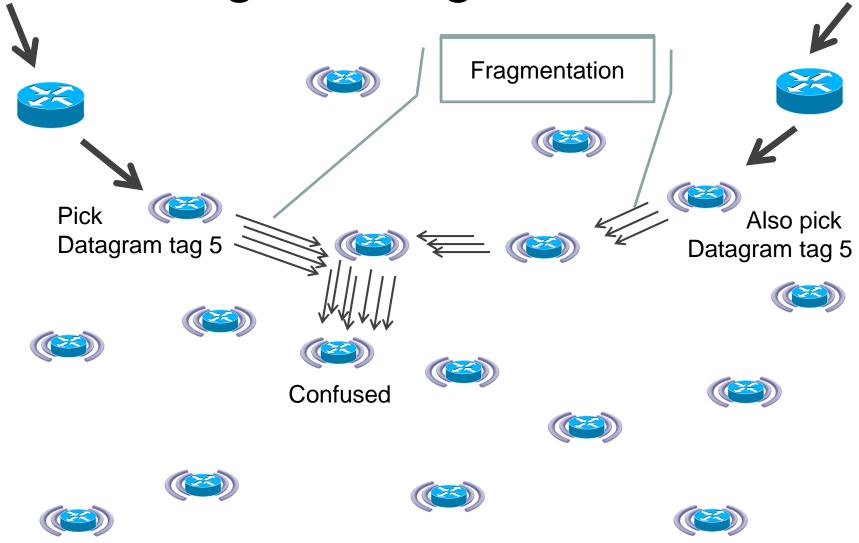

Streamlining with larger window

		Sender	Router 1	Router 2	Receiver
	T=0	III			
	T=1	II(I)	1		
	T=2	II	(I)	I	
	T=3	I(I)	1	(I)	1
	T=4	I	(I)	1	I
	T=5	(I)	1	(I)	II
	T=6		(I)	I	II
(T=7			(I)	III
	T=8				
	T=9				

Even Deeper fragment forwarding issues #6

- Original datagram tag is misleading
- Tag is unique to the 6LoWPAN end point
- Not the IP source, not the MAC source
- 2 different flows may have the same datagram tag
- Implementations storing FF state can be confused
- Solution is well known, called label swapping
- An easy trap to fall in, need IETF recommendations

Datagram Tag Confusion

Even Deeper fragment forwarding issues #6

- Forwarding Fragments requires state in intermediate nodes
- This state has the same time out / cleanup issues as in the receiver end node
- Solution is well known: Proper cleanup requires
 - signaling that the flow is completely received
 - or reset

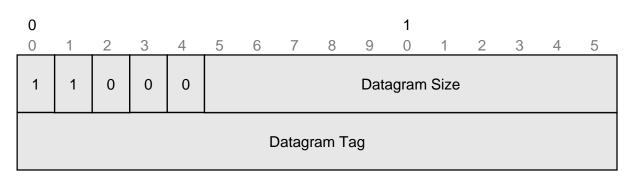

Conclusion

- People are experiencing trouble that was predictable from the art of Internet and Switching technologies
- The worst of it (collapse under load and hard-todebug misdirected fragments) was not even seen yet but is predictable
- Some issues can be alleviated by Informational recommendations
- Some require a more appropriate signaling
- Recommendation is rethink 6LoWPAN fragmentation

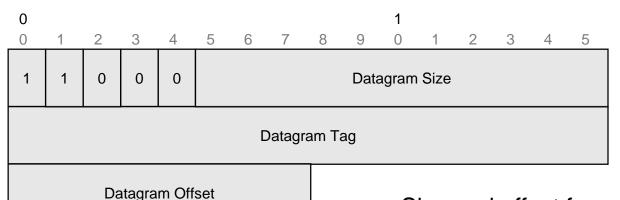

draft-thubert-6lo-forwarding-fragments

- Provides Label Switching
- Selective Ack
- Pacing and windowing + ECN
- Flow termination indication and reset
- Yes it is transport within transport (usually UDP)
- Yes that is architecturally correct because fragment re-composition is an endpoint function
- And No splitting the draft is not appropriate, because the above functionalities depend on one another.
