## Updates on Section 4: Compressed Time Encoding

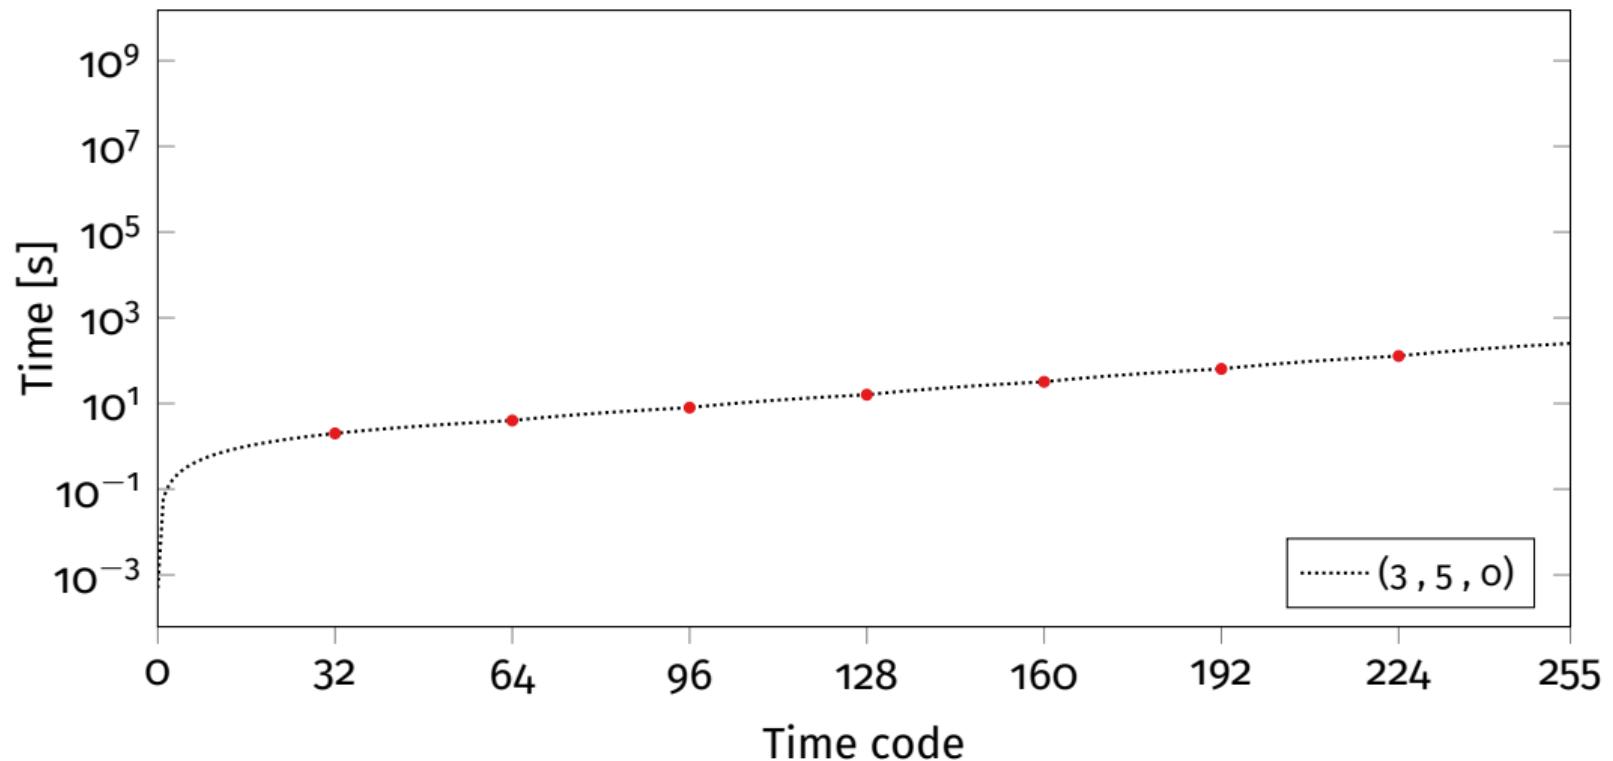

- ▶ Update formulae based on IEEE 754 (Thanks to Marc for this hint)
- ▶ Add sample values to show time ranges of the selected configuration

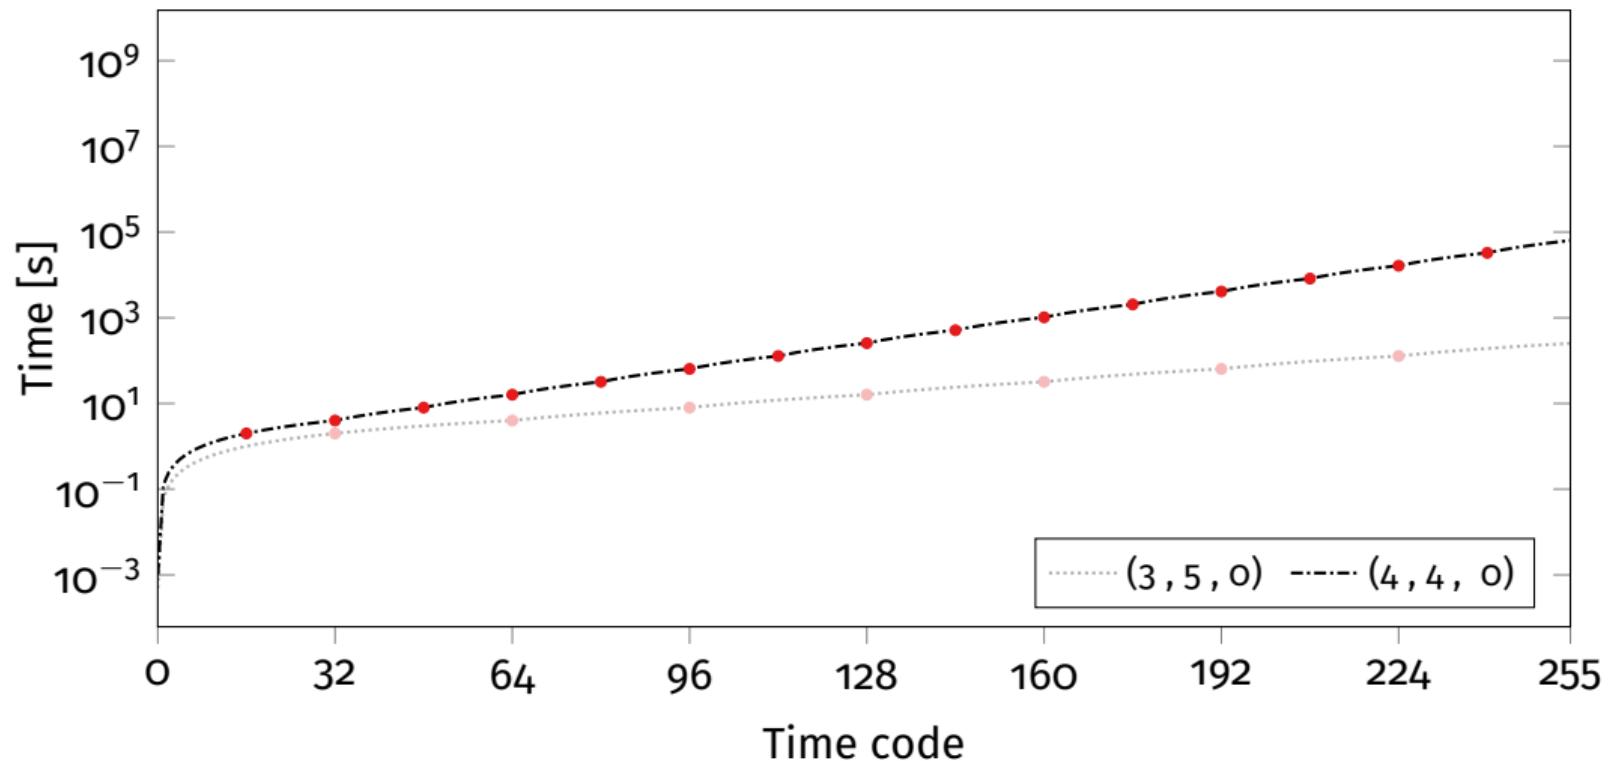

$$t(e, m, b) = \begin{cases} \left(0 + \frac{m}{m_{\max}}\right) \cdot 2^{(1+b)} & e = 0 \quad \text{subnormal} \quad (1) \\ \left(1 + \frac{m}{m_{\max}}\right) \cdot 2^{(e+b)} & e > 0 \quad \text{normalized} \quad (2) \end{cases}$$

time value  
in seconds

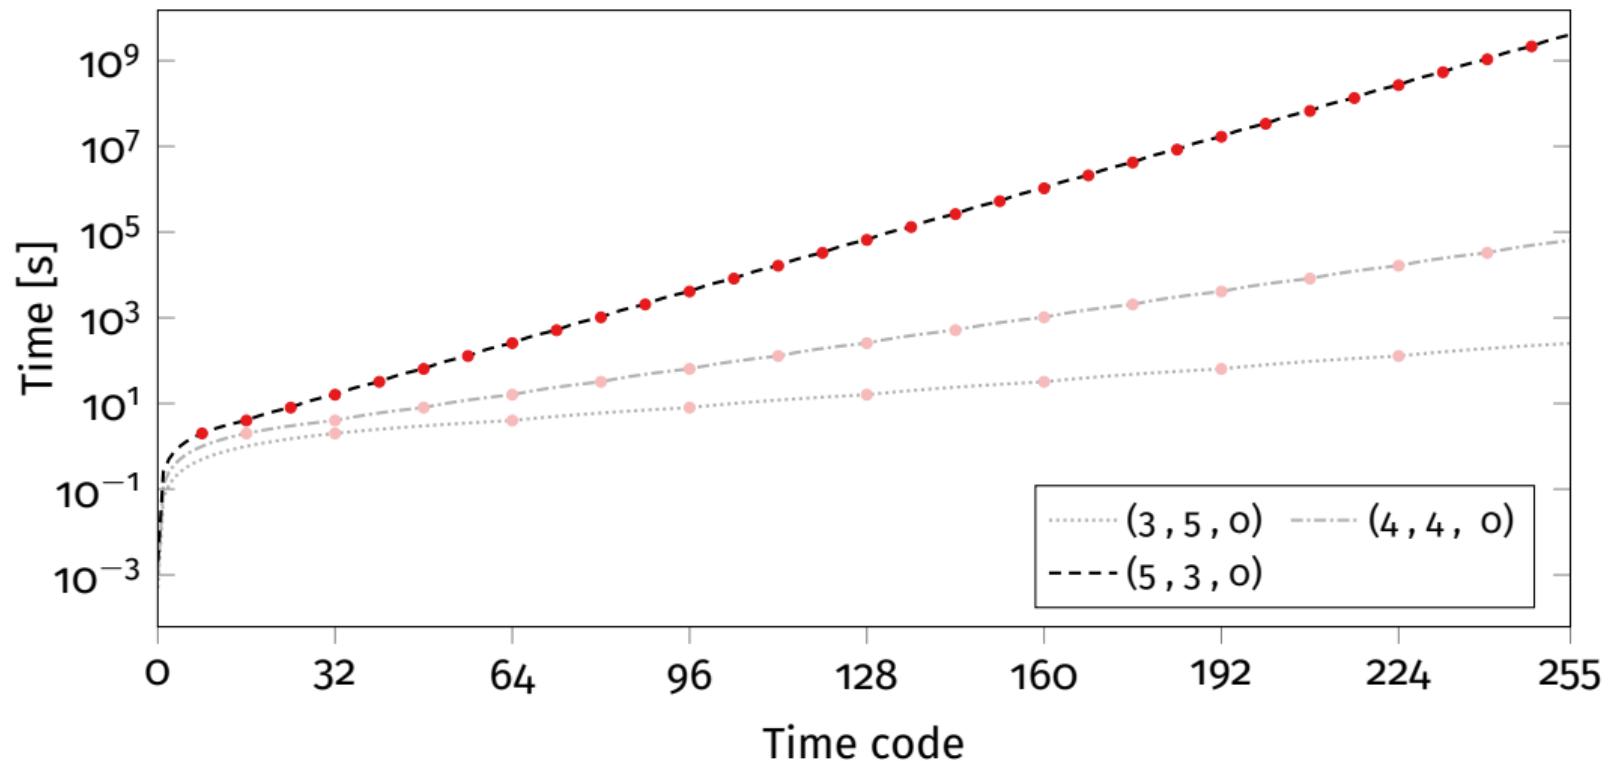

## Precision & Range of Selected Configurations (exp., mant., bias)

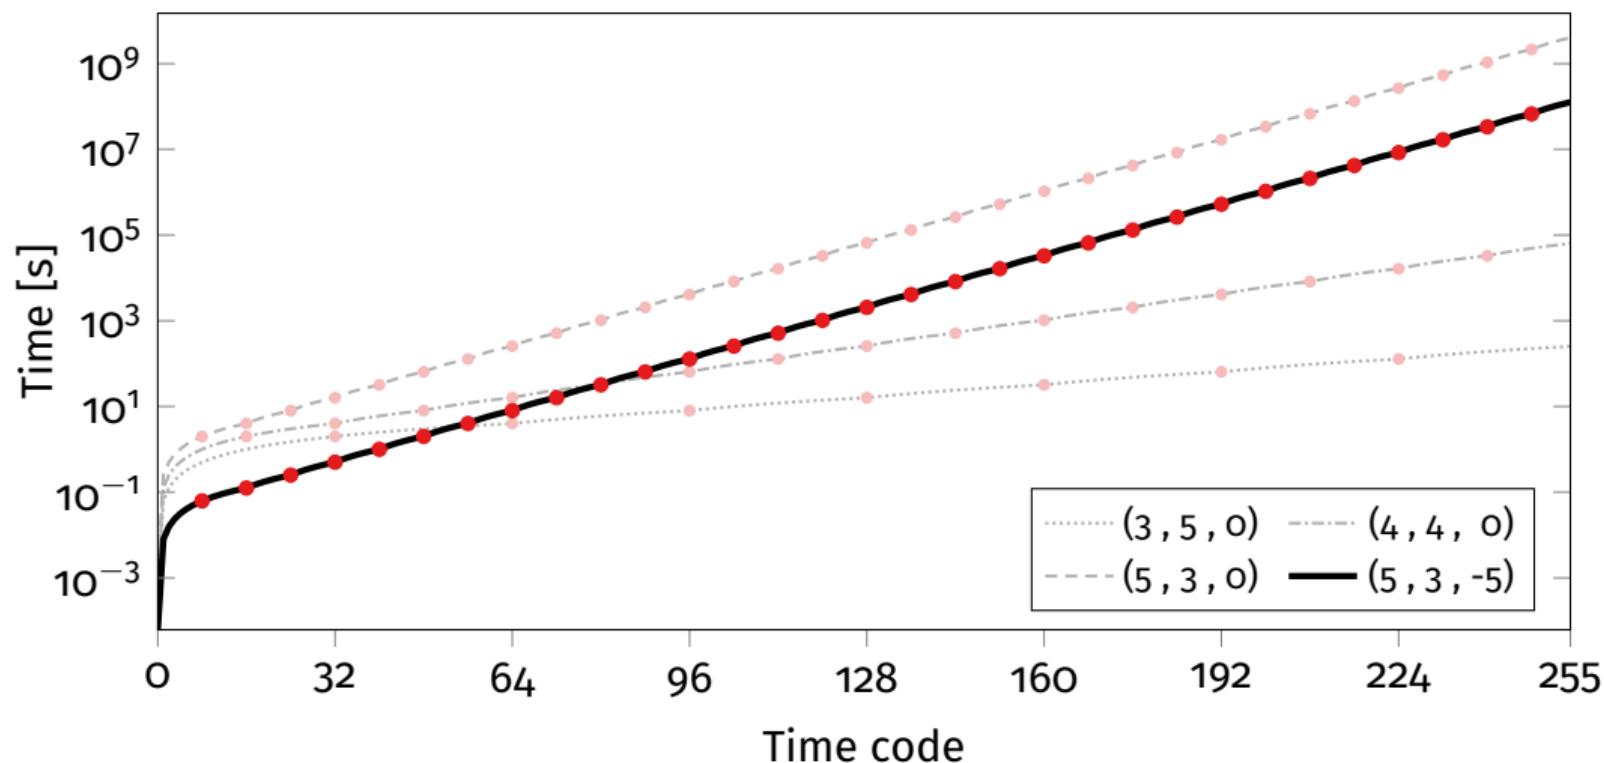

## Precision & Range of Selected Configurations (exp., mant., bias)

# Precision & Range of Selected Configurations (exp., mant., bias)

# Precision & Range of Selected Configurations (exp., mant., bias)

## Updates on Section 5: Protocol Integration

- ▶ Compression for Interest Lifetime (IL) & Recommended Cache Time (RCT)
- ▶ RCT turns into relative time in compressed form
- ▶ Use compressed time encoding, if TLV Length == 1

## Alternative Integrations

- ▶ Nested TLV (likely to introduce overhead)
- ▶ New Top-TLV variants, e.g., Interest-Lifetime-Compressed

## Next Steps

Further discussion needed for:

- ▶ Protocol integration

Based on feedback from Marc:

- ▶ Add table of all time values for (5 , 3 , -5) to appendix
- ▶ Provide pseudo algorithm to convert to and from time codes in appendix

**Ready for RG adoption?**
