

Flexible IPv6 Migration Scenarios in the Context of IPv4 Address Shortage

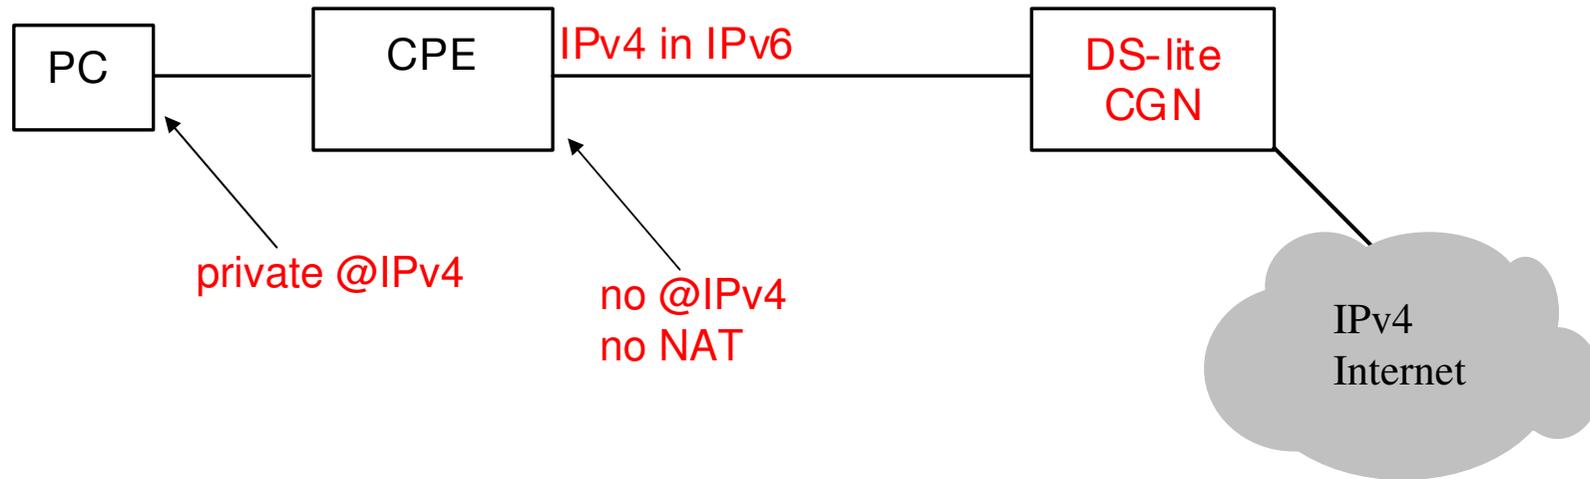

**I-D.boucadair-behave-ipv6-portrange and
I-D.boucadair-softwire-dslite-v6only**
Softwire WG Interim Meeting-BEIJING, September 2011

M. Boucadair et al.

IPv6 context

- ISPs wishing to:
 - Migrate towards an IPv6-only network
 - Offer connectivity to the IPv6
 - Offer connectivity to the IPv4 Internet, saving their public address space
- We present a solution which allows to use IPv6 transfer capabilities and eases removing CGN devices from the network (CGN Exit Strategy)

DS-Lite CGN and PRR

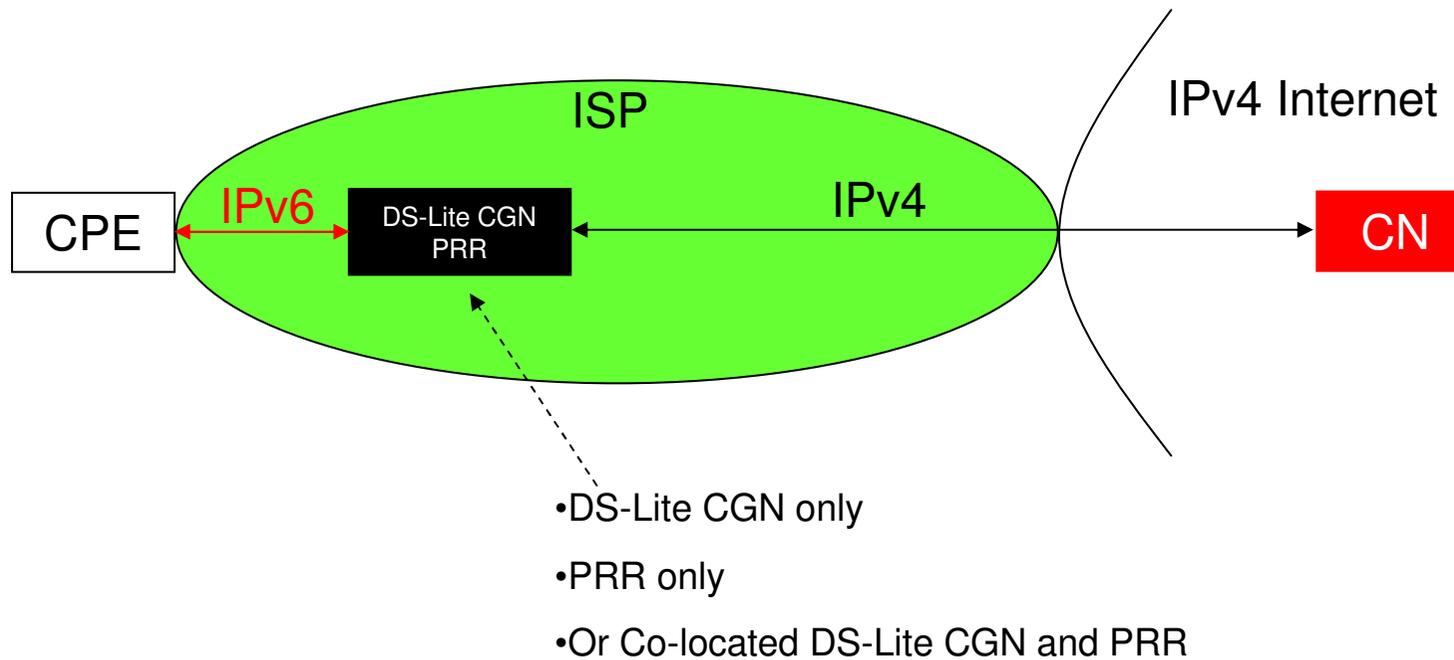

DS-Lite CGN and PRR

PRR: Port Range Router

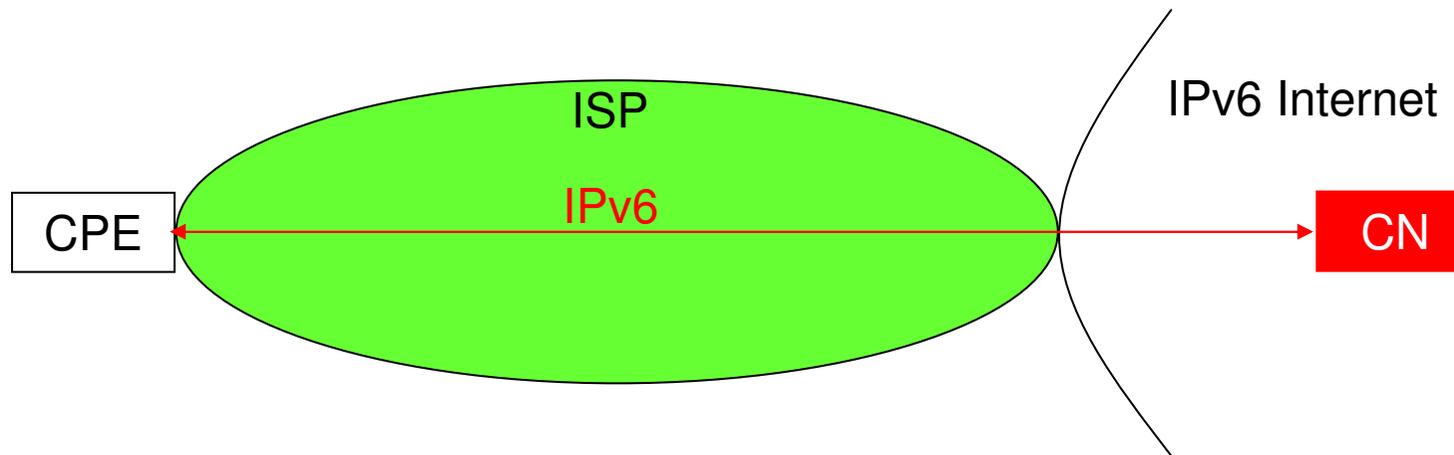

IPv4 Internet Connectivity with IPv6 in Access only

CPE: Customer Premises Equipment

CN: Correspondent Node

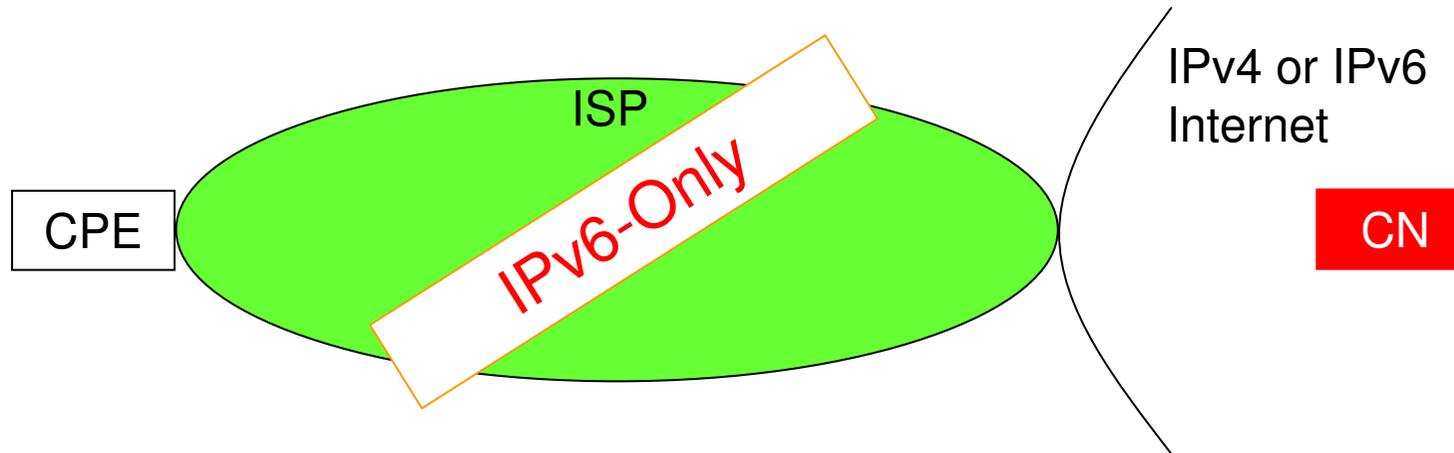

IPv6 Internet Connectivity

CPE: Customer Premises Equipment

CN: Correspondent Node

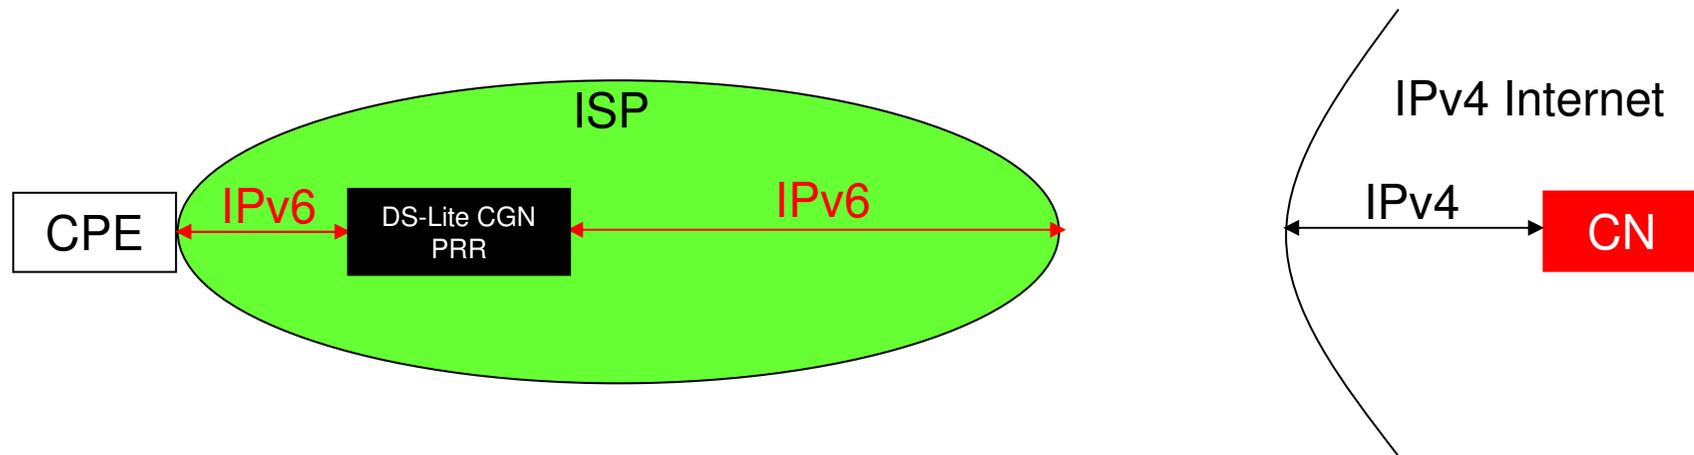

A voluntary migration towards IPv6

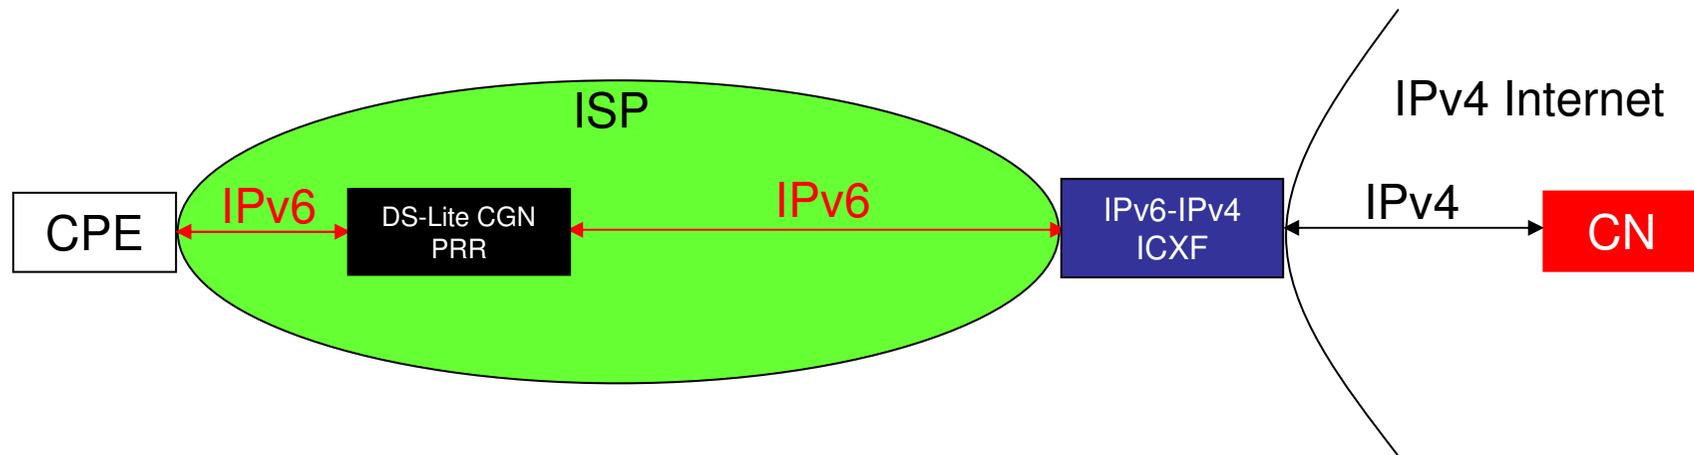

CPE: Customer Premises Equipment

CN: Correspondent Node

IPv4 Internet Connectivity with IPv6 in Access and Core

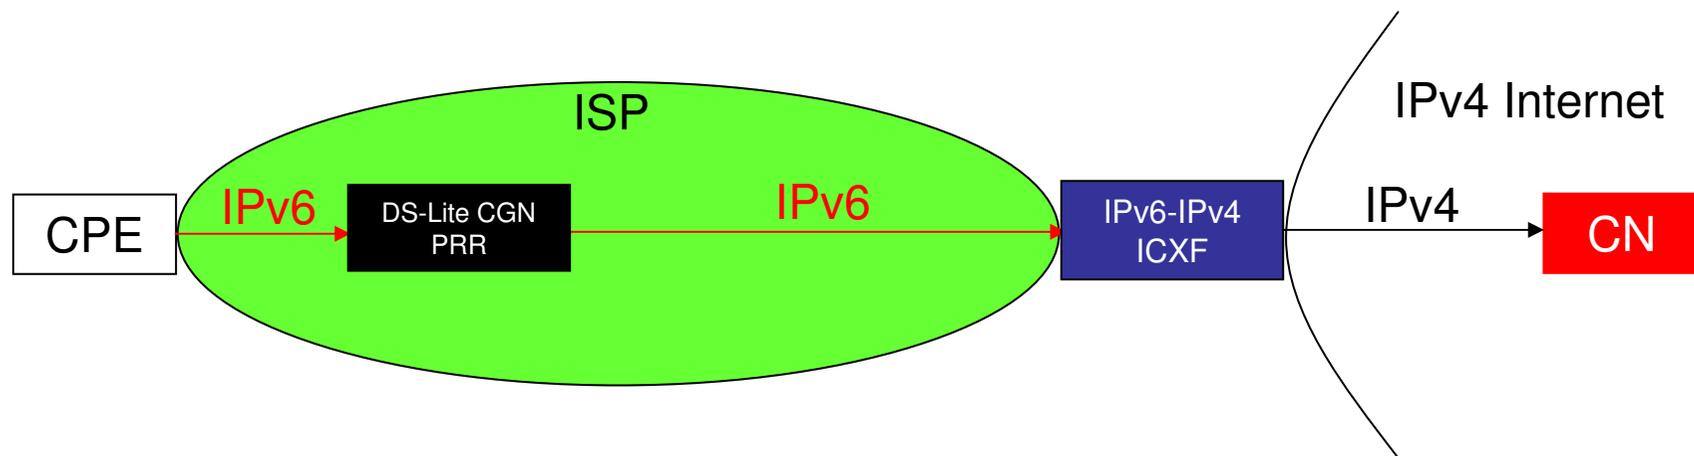

IPv4 Internet Connectivity with IPv6 in Access and Core

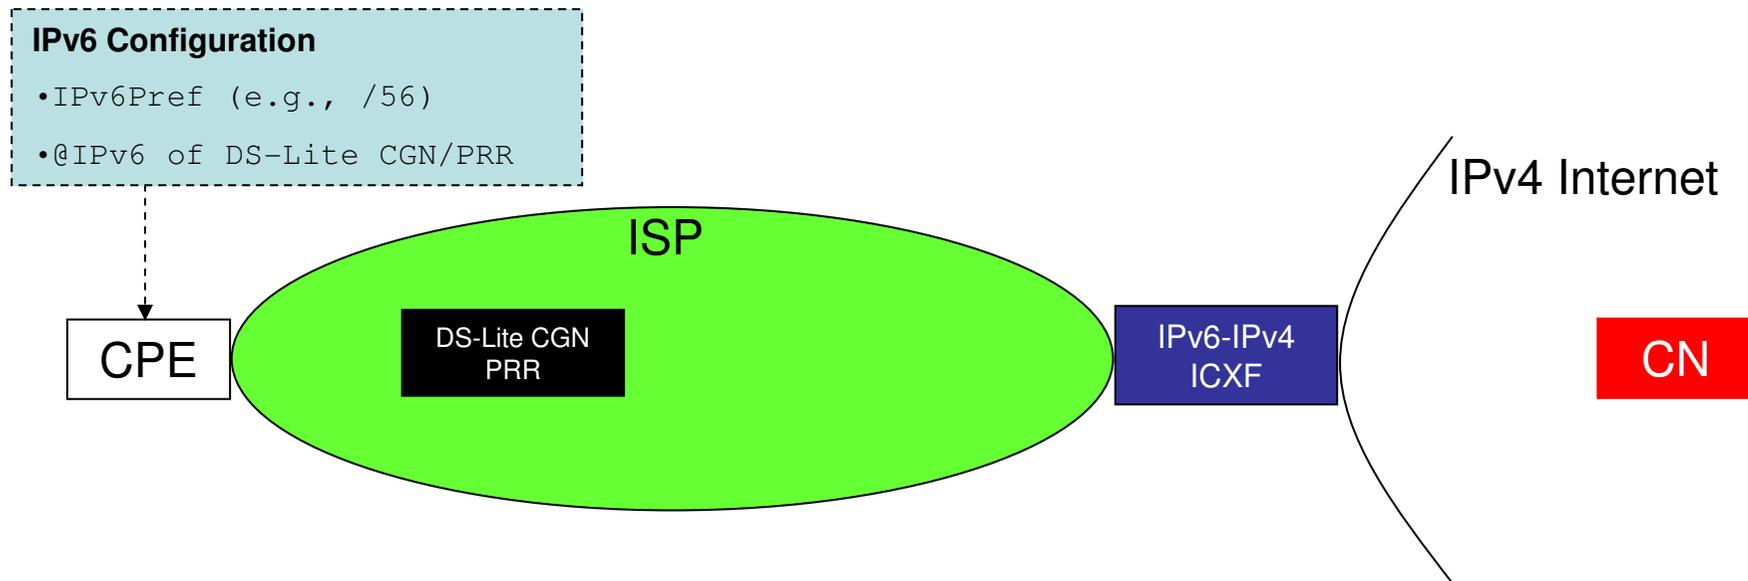

ICXF: Interconnection Function

Tromboning Issue

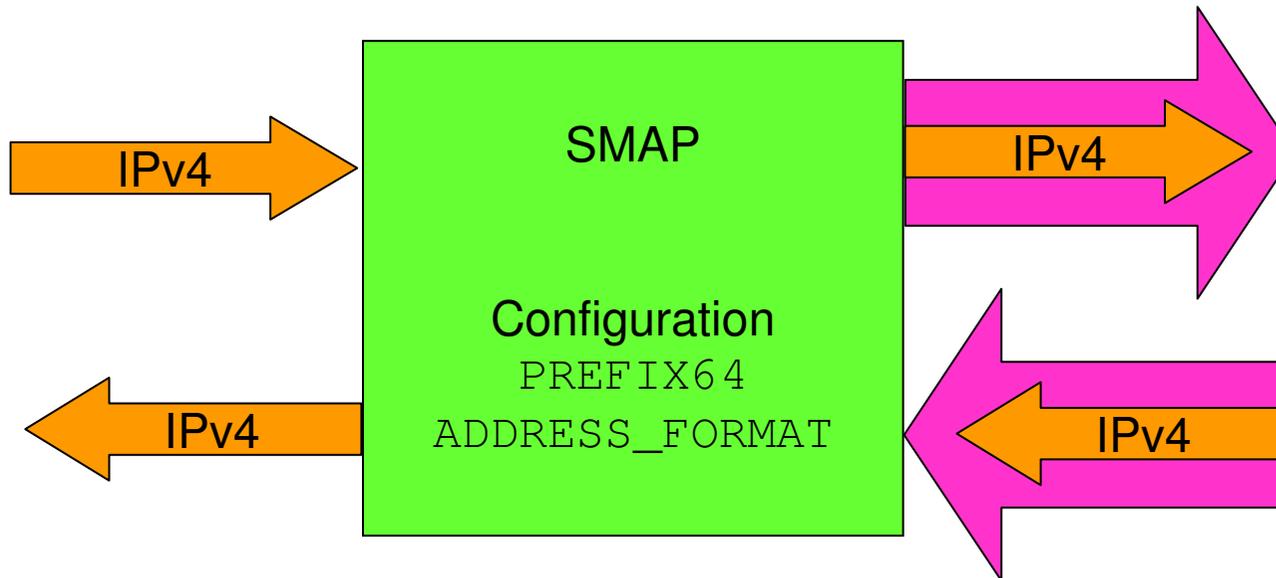

Removing CGN and PRR

Removing CGN and PRR

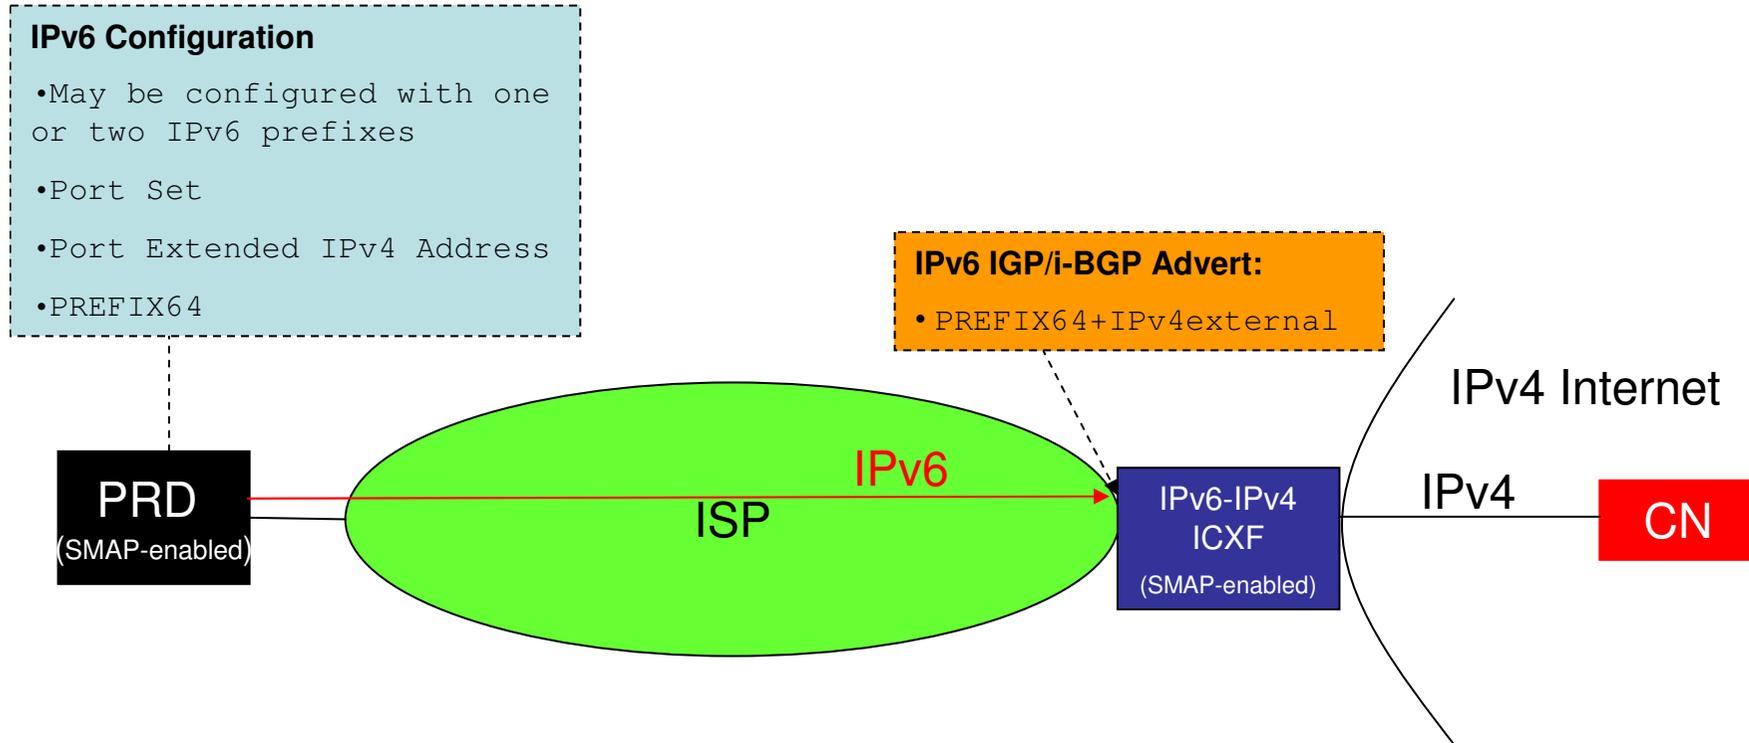

SMAP: Stateless A+P Mapping Function

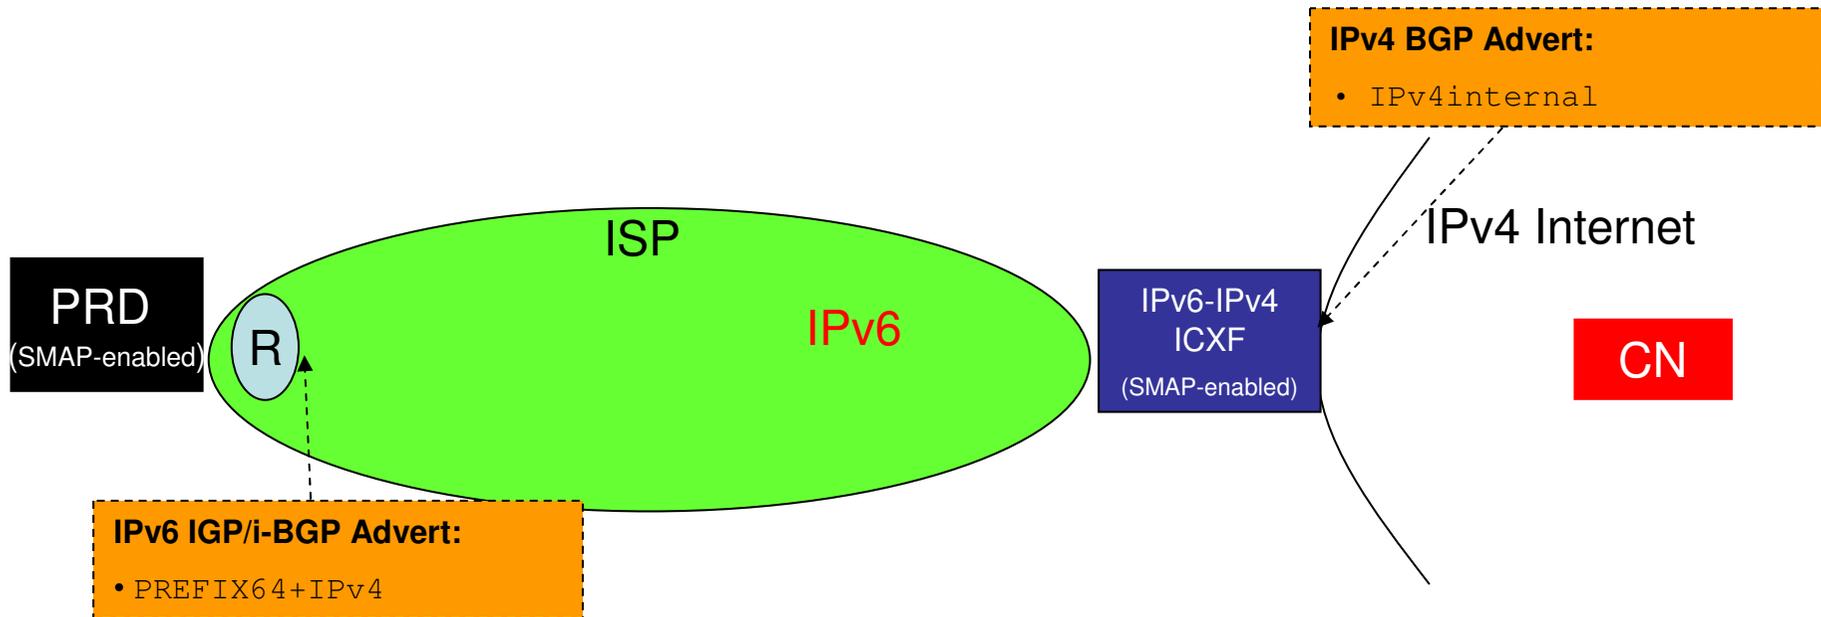

- SMAP can be embedded in a CPE, ICXF, CGN, PRR
- SMAP prepends the IPv4 address and port number to a pre-configured PREFIX64 and address format
- SMAP proceeds to stateless encapsulation and decapsulation of IPv4 datagrams into IPv6 datagrams

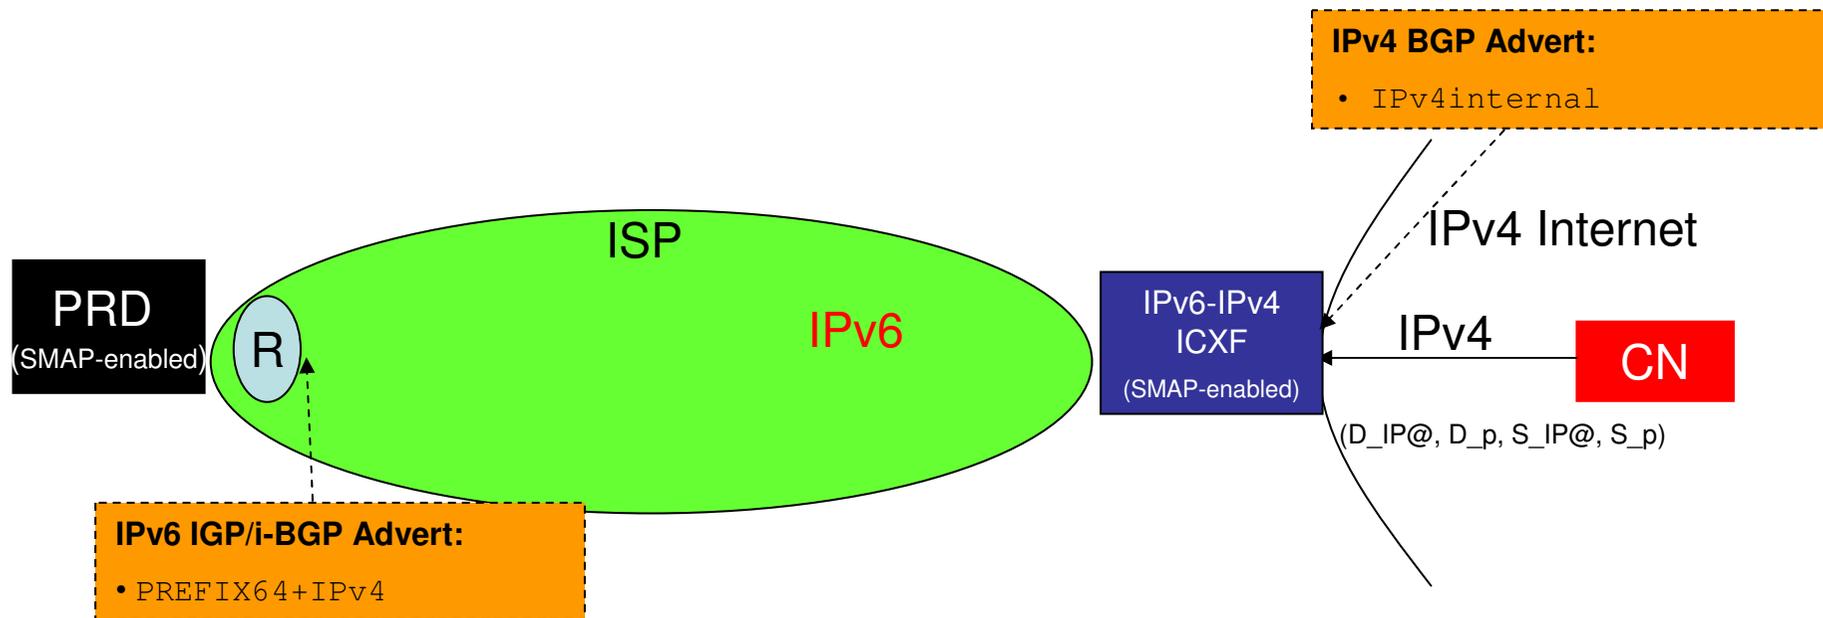

Removing CGN and PRR

CPE-CPE Communications

Prefix and Address Formats

PREFIX Format
PRM: refers to the value of the significant bits of the port range mask

Address Format

Port Range Mask

- Simple
 - Similar to Subnet Mask
- Hierarchical structure
- Flexible
 - For stateless schemes the significant bits forming the Port Range Mask must be consecutive
- Allows differentiated port set schemes bound to same shared IPv4 address
- Compliant with RTP/RTCP applications
- Allows to assign 0-1023 range to a user
- SP can be enforce its own policies w.r.t. port ranges to be allocated to requesting users
- Etc.

Port Range Example

- Ex (contiguous):
 - Value **1**000000000000000000
 - Mask **11**0000000000000000
 - Port Range 32768–49151
- Ex (non-contiguous):
 - Value 000000**00**0000000000
 - Mask 000000**11**0000000000
 - Port Range 0–255, ... , 64512–64767
(64 ranges)
- Other examples are given in the draft

Conclusion

- Stateless encap/decap functions
- IPv6 Routing does not take into account Port Range (can be dynamic)
- Provide flexibility for DS-Lite vs. Port Range selection
 - Vendors can implement both DS-Lite CGN and PRR functions in the same device
 - Same IPv6 requirements on the customer devices for both DS-Lite and IPv6 Port Range
 - IPv6 prefix
 - IPv6 address to reach PRR/DS-Lite CGN
- Allows to remove CGN/PRR from the path while continuing to deliver IPv4 services over an IPv6-only ISP network
