

# Public Access WiFi Service (PAWS)

**Arjuna Sathiaseelan**

[www.cl.cam.ac.uk/~as2330](http://www.cl.cam.ac.uk/~as2330)

**along with Richard Mortier, Murray Goulden, Christian Greiffenhagen,  
Jon Crowcroft, Milena Radenkovic and Derek McAuley**

# Internet access is challenged

## ❑ **Geographic**

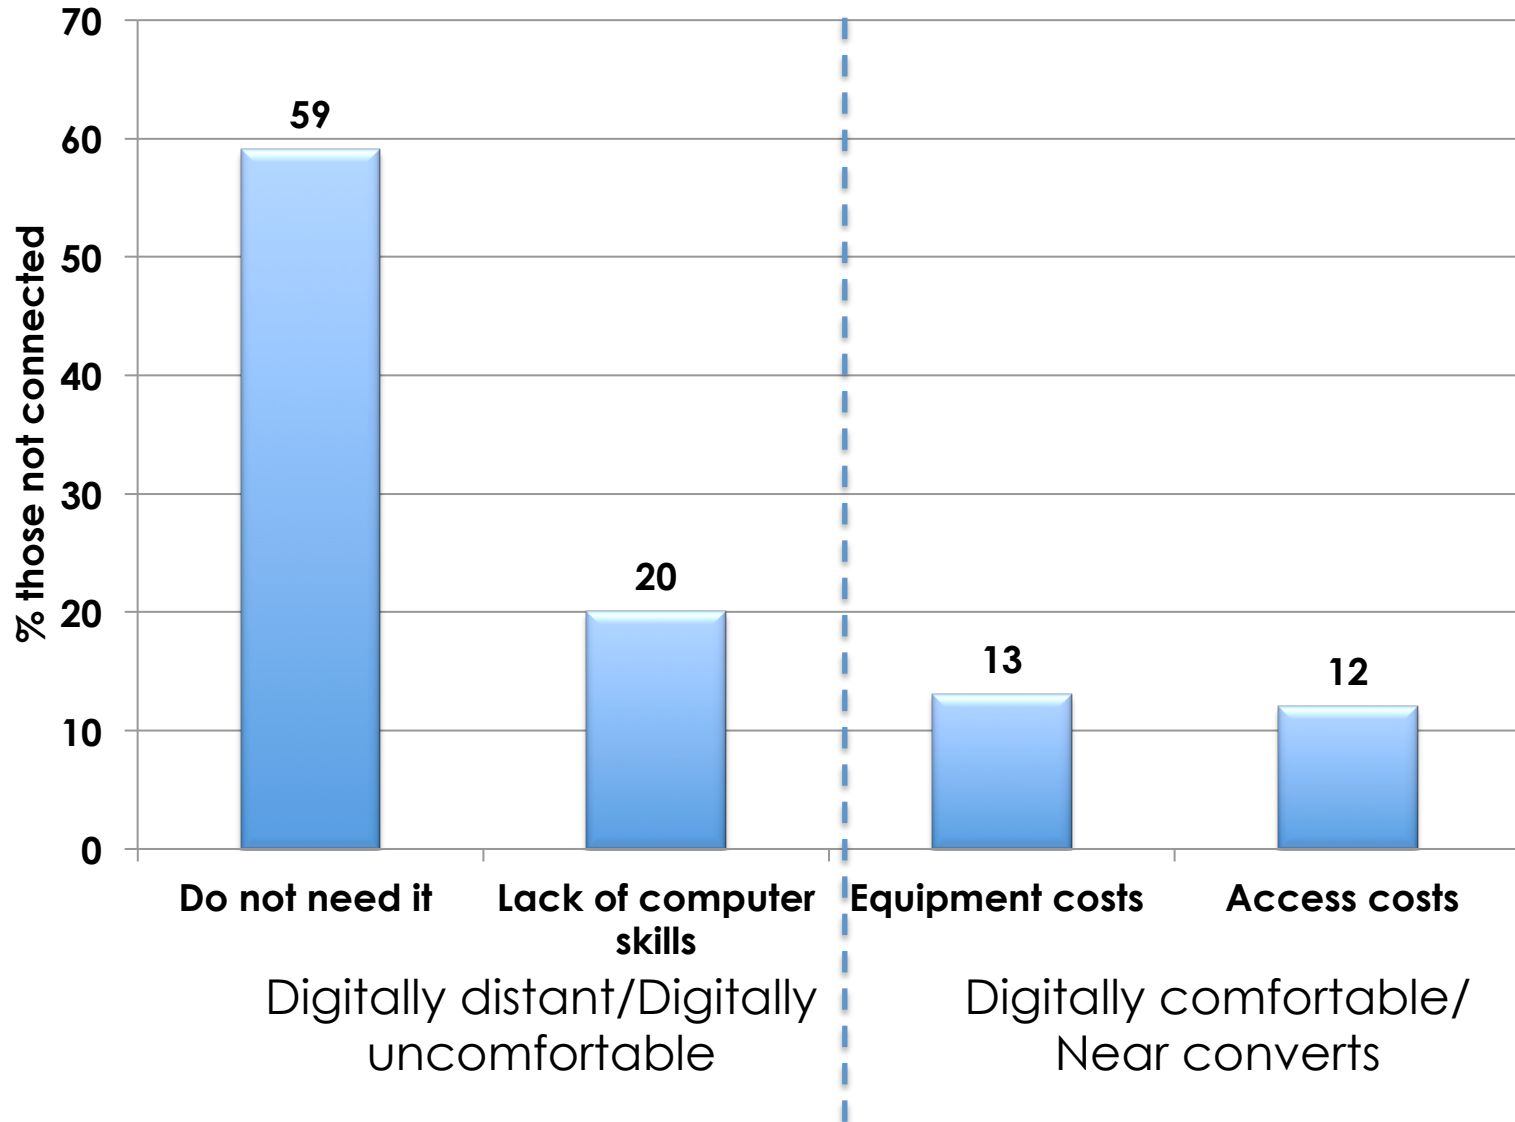

- ❑ Conventional Internet access has physical limitations
- ❑ Not economically feasible for a network operator to provide coverage

## ❑ **Economic**

- ❑ Access to fixed broadband in some developing countries costs almost 40x-100x the national average income
- ❑ In developed countries, affordability limits broadband access in impoverished communities

## ❑ **Regulatory, Social & Capacity building challenges**

# Mandatory to solve the Socio-Economic Problem

ONS 2013: 4 million households without internet access

# Lowest Cost Denominator Networking (LCDNet) Vision

- ❑ How do we make Internet access free at the point of use
- ❑ Solve the problem of digitally comfortable/near converts
- ❑ Provide opportunities for digitally distant/digitally uncomfortable to explore the benefits of Internet
- ❑ “An environment that stimulates curiosity can cause learning through self-instruction and peer-shared knowledge” - Sugata Mitra (Hole in the Wall)

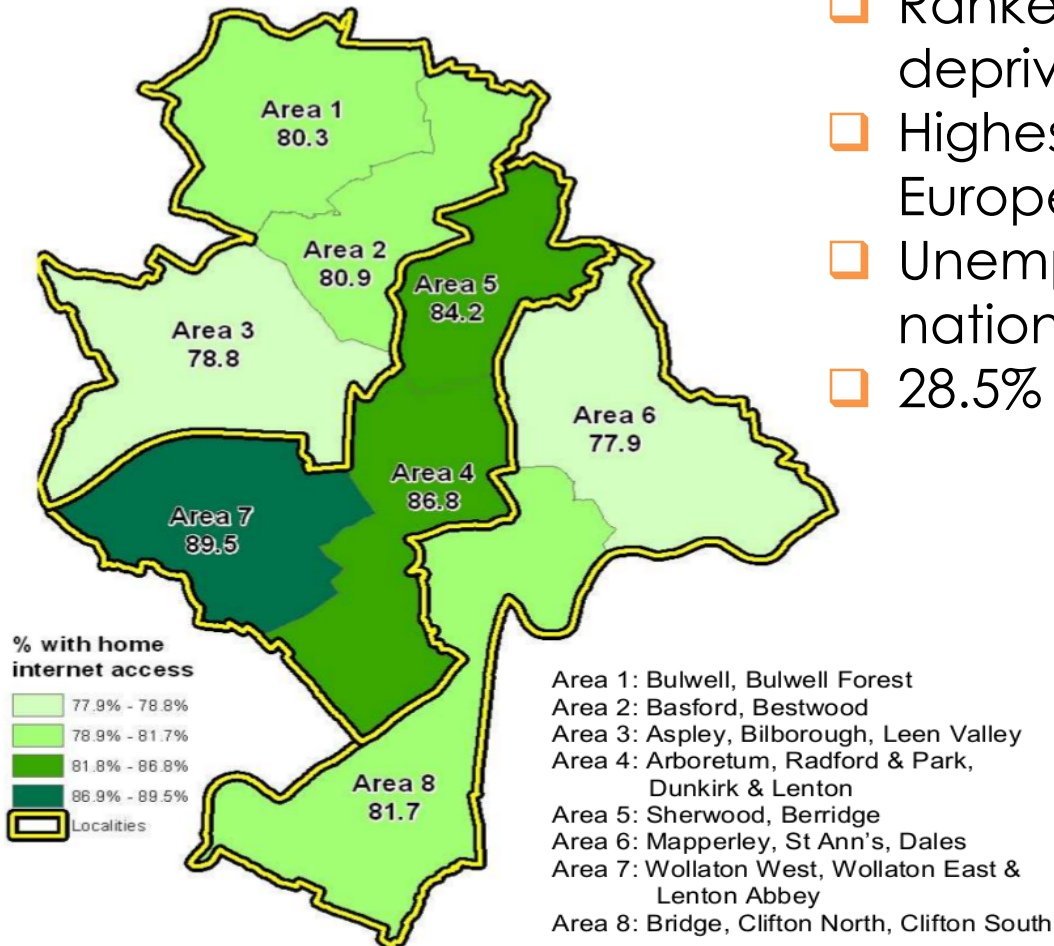

# Public Access WiFi Service (PAWS)

- ❑ An in-the-wild attempt to explore a solution to solve the urban broadband affordability problem
- ❑ Funded by the EPSRC - Cambridge (Lead), Nottingham, BISMark, BT, SamKnows, Nottingham City Council
- ❑ Can the “*have nots*” piggyback on existing home broadband of the “*haves*” for free and at lower quality?
- ❑ In-the-wild Research with real users:
  - ❑ Would this work?
  - ❑ What are the challenges?
  - ❑ What are we going to learn in the process?

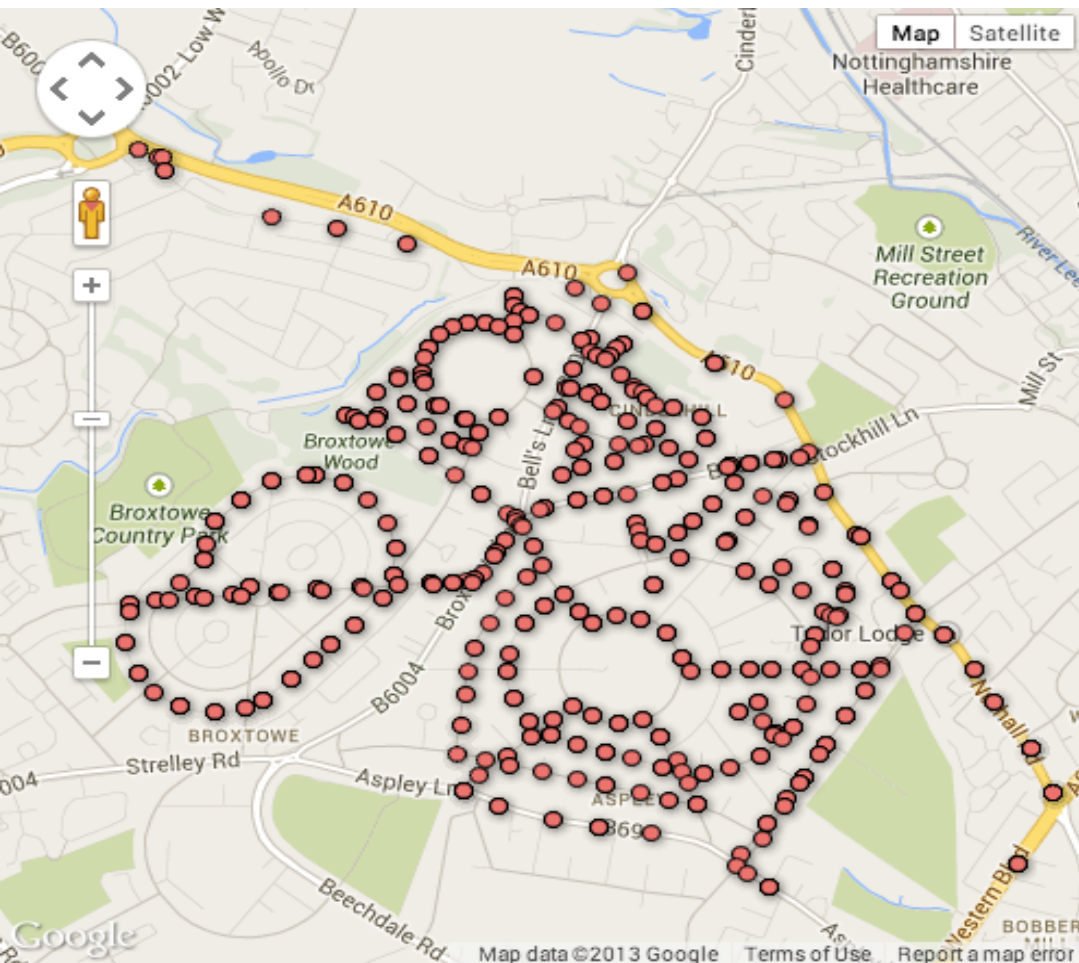

# Study Context: Social

- ❑ Nottingham: Medium sized city with a population ~300,000
- ❑ Aspley: population of >16,000 in ~6280 households (2004 estimate)
- ❑ Ranked bottom 10% nationally for deprivation
- ❑ Highest teenage pregnancy in Europe
- ❑ Unemployment rate of over 10% (3x national average and 2x city)
- ❑ 28.5% are digitally excluded

# Study Context: Technical

- 52% of 16-24 and 23% of skilled working class, working class and non-working class have smartphones (2011 estimates)
- Wardrive sampled 40% of the streets
- Found 1067 unique APs

Provider	Percentage
SKY	23%
Virgin	21%
BT	23%
FON	61% of BT
Unspecified	33%

# Recruitment unravels

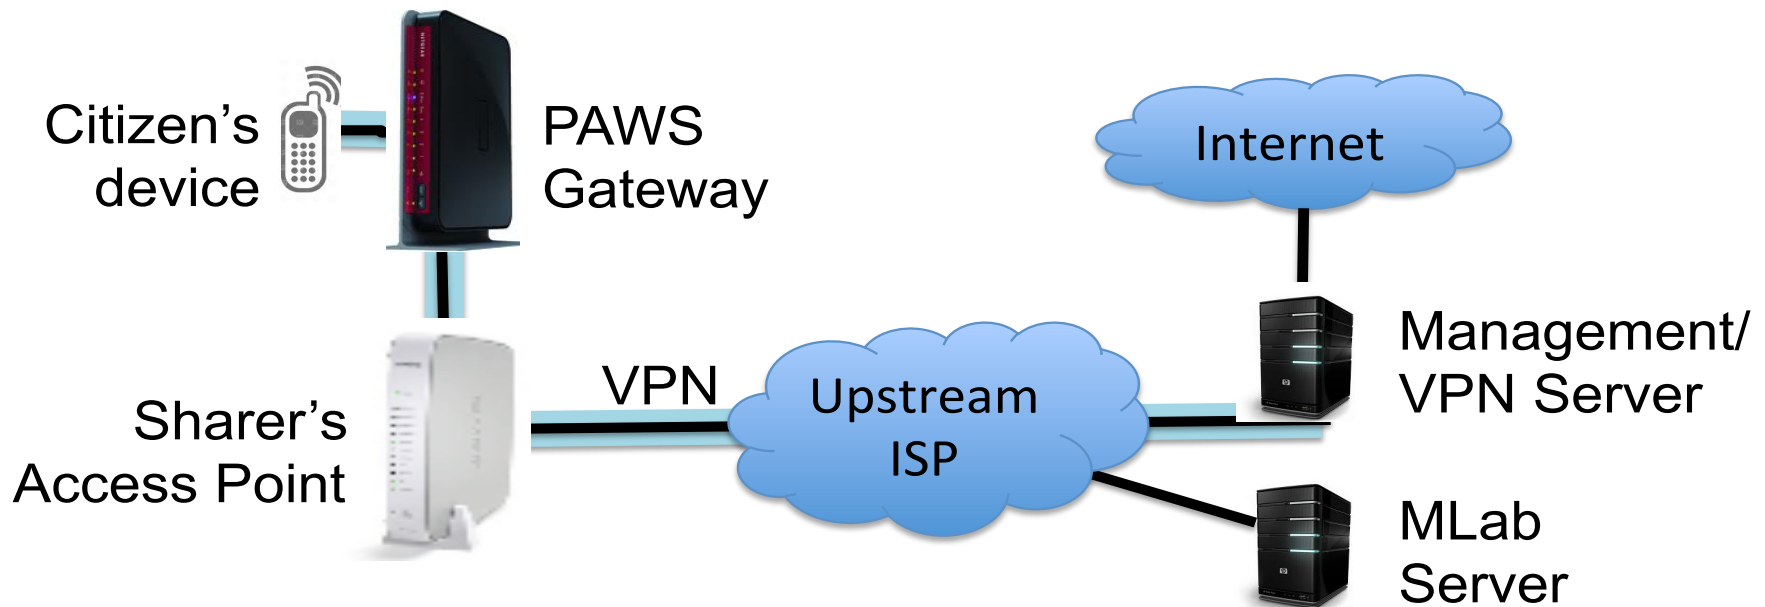

# Recruitment

- ❑ Recruitment specifically targeted the “near converts” and the “digital hopefuls” where cost is the main barrier to adoption (Horrigan, 2011)
  - ❑ Not the “digitally uncomfortable” and “digitally distant”

Doors Knocked	~2158
Recorded responses	730
Potential Sharers	98 (18.3%)
Potential Citizens	36(4.9%)
Sharers (PAWS installed)	20
Citizens (via self signup)	54
Active Citizens	18 (two from recruited, others via self signup)

# PAWS: Technical Architecture

- ❑ VPN (PPTP and L2TP support)
- ❑ Firewall policies (DHCP, ICMP, DNS, management, VPN, measurement server, HTTP/HTTPS redirected to self signup page)
- ❑ Enabling Less than Best Effort (LBE) access
  - ❑ WiFi access points : lack of QoS (both upstream and wireless)
  - ❑ DSLAM/MSAN: Need L2 QoS differentiation
  - ❑ PAWS: We throttle at 2Mbps downstream/512Kbps upstream

# # of PAWS routers

ISP	Total	Measured
SKY	6	5
Virgin	10	8
Orange	1	1
TalkTalk	1	1
Tiscali/PIPEX	1	0
Griffin	1	0

- ❑ 20 PAWS routers deployed between July 2013-March 2014
- ❑ 8 were used by 18 citizens: two was deployed in a public space
- ❑ Remaining 12 served as measurement points

# PAWS: Measurements

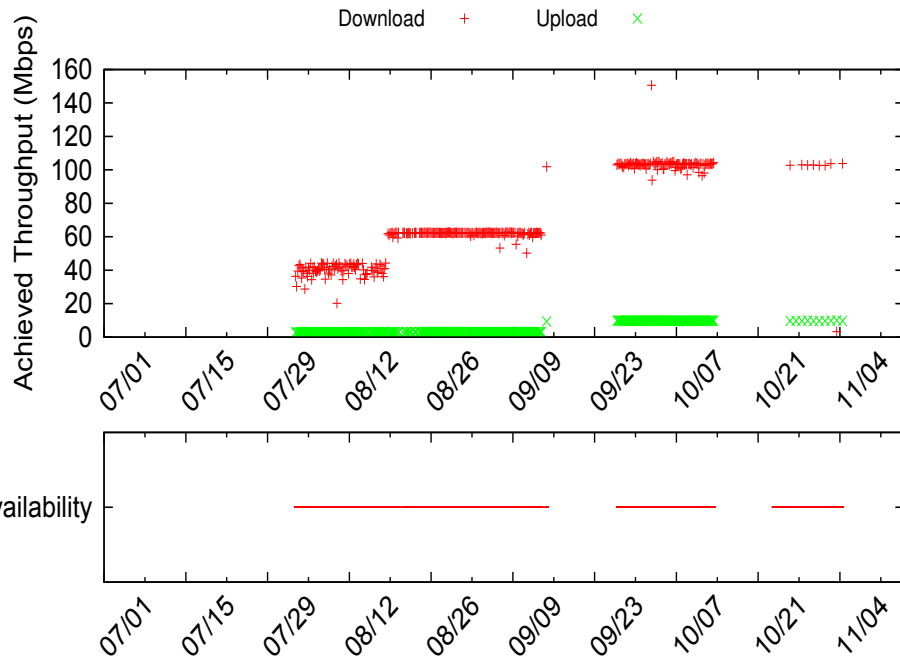

- ❑ Availability
- ❑ How much unused capacity is actually available
- ❑ Citizen Usage

Metric	Method	Frequency
Availability	UDP Probe (60 B)	Every min
Throughput	NETPERF (3 Parallel TCP)	6 hours
Last Mile Latency	Traceroute/Ping to first non-NATed IP	Every 10 mins
E2E RTT	Ping to different servers	Every 10 mins
Loss	D-ITG	Every 15 mins

# PAWS: Availability

# Understanding the Broadband Performance Measurements

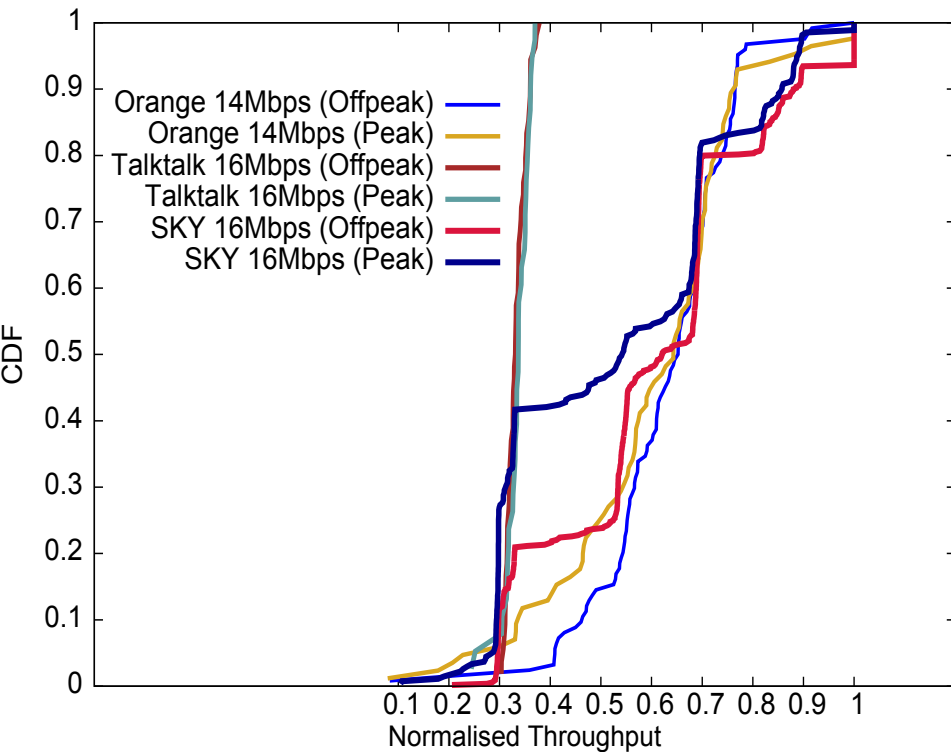

Virgin Fiber  
(60/100Mbps)

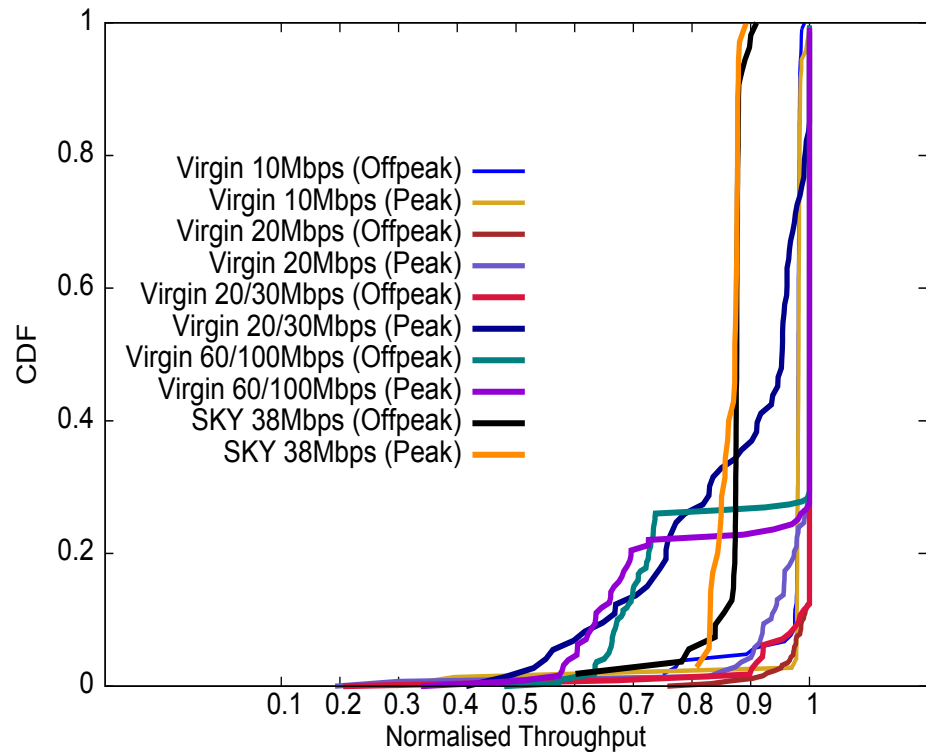

SKY ADSL  
(16Mbps)

# Capacity (download)

ADSL

Fiber

□ Fiber has sufficient capacity to share 2Mbps 100% of the time

# Capacity(upload)

ISP	Min (Mbps)	Max (Mbps)	Average (Mbps)
Virgin 10	0.33	1.00	0.68
Virgin 20	1.01	1.18	1.12
Virgin 20/30	1.05	2.01	1.23
Virgin 60	2.45	3.00	2.94
Virgin 60/100	2.5	9.95	5.15
SKY 38	1.05	2.33	1.97
SKY 16	0.47	1.31	0.91
TalkTalk 16	0.72	0.90	0.87
Orange 14	0.03	1.31	0.60

❑ **Sharing 512 Kbps on upload needs AQM/CoS on home routers/BRAS**

# Last Mile Latency and Loss

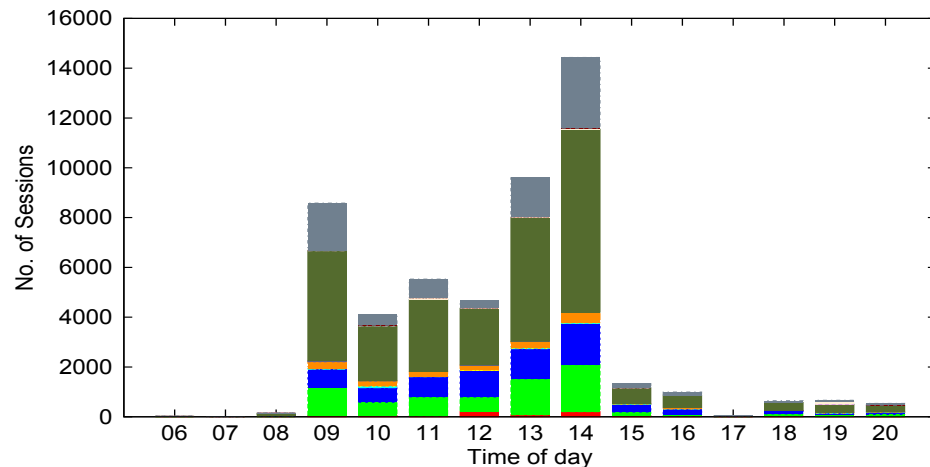

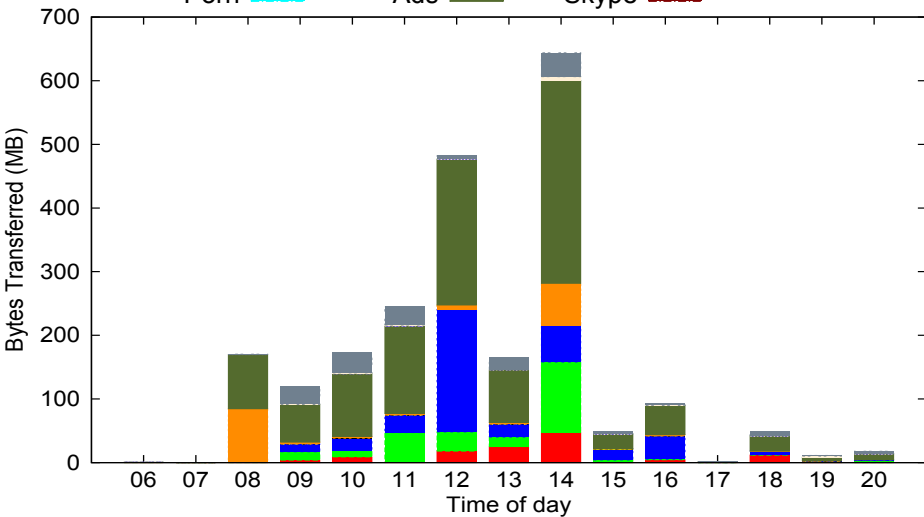

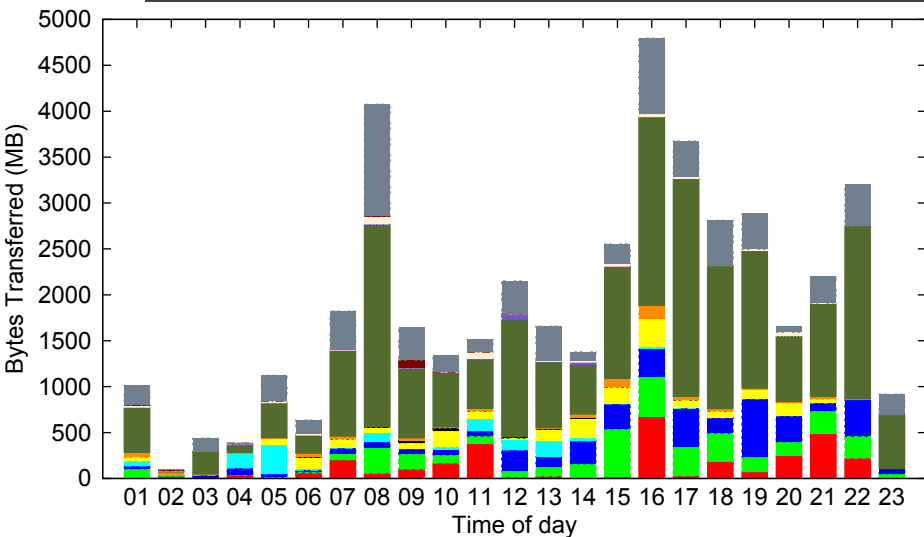

Loss was negligible < 0.07%

# Analysing Citizens Usage

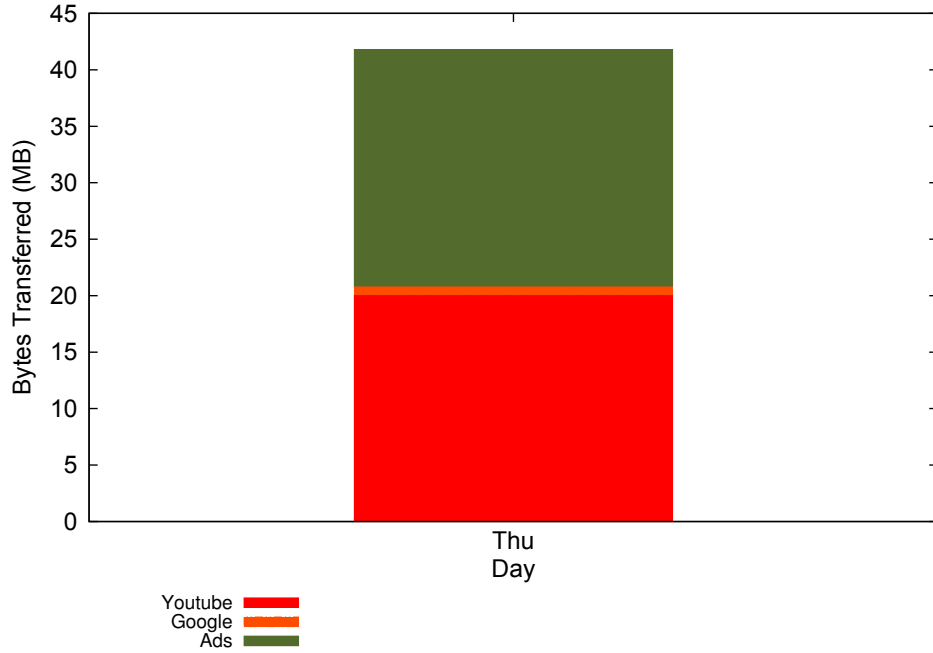

- ❑ Correlated tcpdump packet data with RADIUS logs
- ❑ Total 36GB traffic (15GB upload, 21GB download) by 18 citizens
- ❑ One citizen (primary citizen) stood out with 28GB
- ❑ Devices used: Primary citizen (Windows PC, iPhone), Six citizens connected via local community center (Windows PC), others (Android, iOS (iPad and iPhone)).

Category	Sample keywords/netblocks
Ads	doubleclick, 2mdn, advert, analytics
BBC iPlayer	lplayer, bbci
Jobs	job, reed, vacancy, career, work
CDN	edgecast, akamai, cdn
Games	game, mochi, nextgenhabbo, playfatal
Information	google, facebook, fbcdn, wiki, edu, .ac.uk, 173.194/16
Updates	avast, mcafee, microsoft, apple, norton
Youtube	Youtube
Shop/Bank	tesco, asda, natwest, amazon, gumtree
Porn	xxx, porn, raunch, strip [others]
Other	[unmatched names, IP addresses]

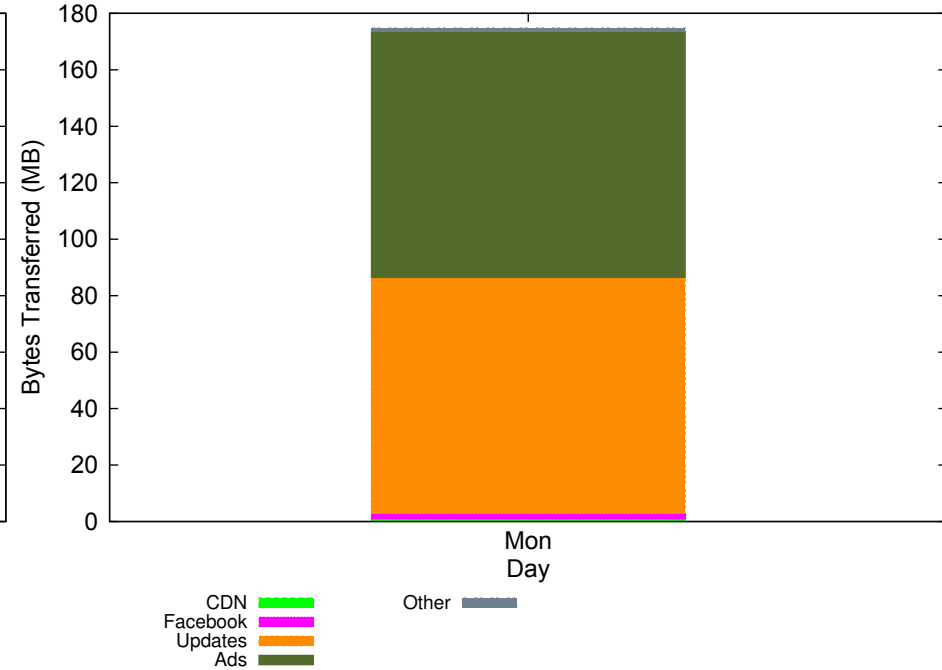

# Citizen Usage (by bytes and sessions)

# The Internet is for ~~Porn~~ Ads

User A

User B

# Citizen Usage

Category	%
<b>Ads</b>	<b>60</b>
Legitimate Uses	22
Youtube	8
Games	5
Porn	3
Updates	2

# Effect of Primary Citizen Usage on Sharer

- ❑ Sharer was on a 20/30 Mbps link
- ❑ Gateway was switched on for 89% of the time
- ❑ Throttling was sufficient

# Sustainability model

- ❑ Extend stakeholder value chain for incentivizing access by creating new Virtual Network Operators that have a socio-environmental objective (e.g. local government, NGO)
  - ❑ Digital by default programme could achieve savings of £2.2 bn/year!
- ❑ Ads are a main driver of traffic
  - ❑ Can we get ad providers to pay for the extra traffic?
- ❑ Share costs: Decouple CAPEX and OPEX - NO can setup or use existing infrastructure while VNO can manage the infrastructure or vice versa
  - ❑ Software Defined Networking would facilitate such decoupling and enable flexible management

# Lessons Learnt through PAWS

- ❑ Deprived urban areas have network infrastructure with good capacity
  - ❑ Fibre networks ideal candidates for network sharing
  - ❑ ADSL is common - need better QoS to support
- ❑ It was easy to recruit sharers!
  - ❑ Sharers did not complain or perceive any performance issues while sharing
  - ❑ WiFi stack issues, usage caps
- ❑ It was harder to recruit the citizens!!
  - ❑ Quotes from an interview with a "*digitally distant*"
    - ❑ "Do you have the Internet?" "No"
    - ❑ "Would you like to?" "No, that's alright. I'm not interested."
    - ❑ "May I ask why not?" "Cos it's a load of fucking bullocks."
- ❑ Citizens had to overcome WiFi coverage, VPN issues (54 signed up, only 16 used!), Network availability
- ❑ However the primary citizen was able to use the network reasonably well

# Summing up..
