

SCReAM-03

updates and evaluation

draft-johansson-rmcat-scream-cc-03

Zaheduzzaman Sarker

Ericsson Research

AGENDA

- › Updates on SCReAM
- › Basic test cases evaluation results
- › Cellular test cases evaluation results

ADDITIONS AND CHANGES

Additions

OWD trend

- Product of 1st order OWD prediction and OWD fraction
- Gives an earlier warning of congestion → Less risk of jitter spikes

Target rate increases slowly when :

- OWD trend is high
- Target rate is close to last known congested bitrate (inflection point)

Changes

More descriptive

Removed pseudo code

BASIC TEST CASES EVALUATION

INTRODUCTION

Tests done according to draft-ietf-rmcat-eval-test-00

Presented results have

- One way propagation delay = 50ms

Algorithm

- **Self-Clocked Rate Adaptation for Multimedia (SCReAM)**
 - draft-johansson-rmcat-scream-cc-03
 - Video codec frame skipping enabled (threshold 100ms)
 - Frame blanking disabled
 - Competing flow adjustment disabled

VARIABLE BW SINGLE FLOWS (DROP TAIL 300MS)

SCReAM -03

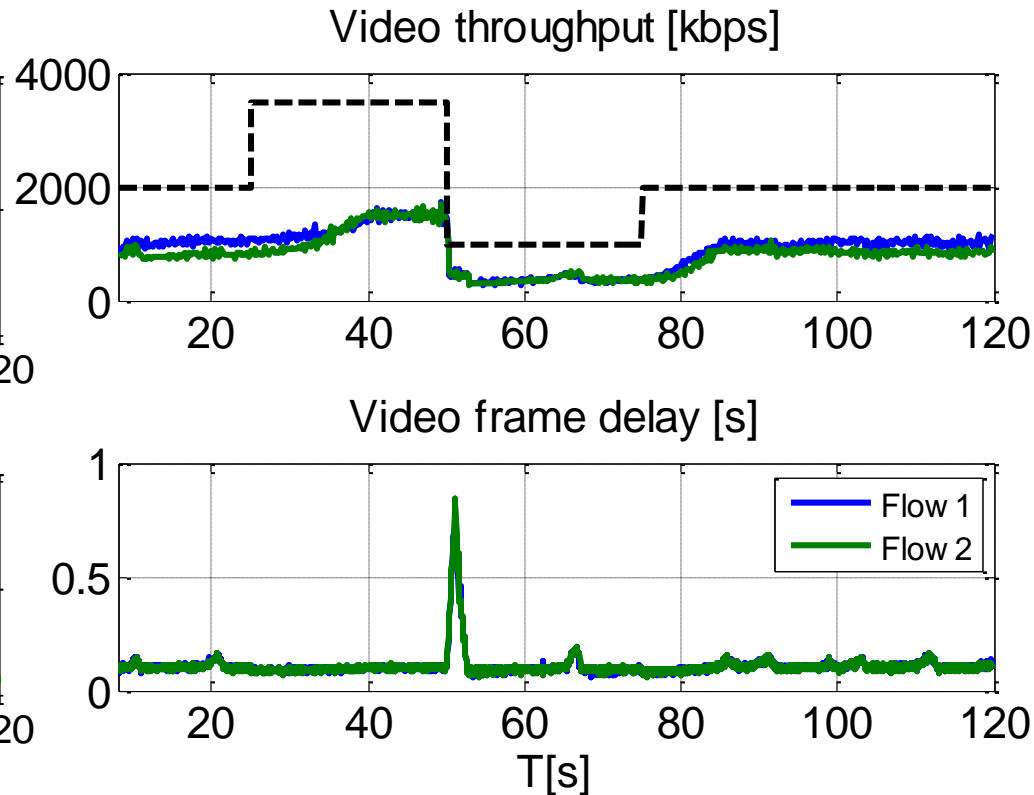

VARIABLE BW MULTIPLE FLOWS (DROP TAIL 300MS)

More fair, stable and less jitter.

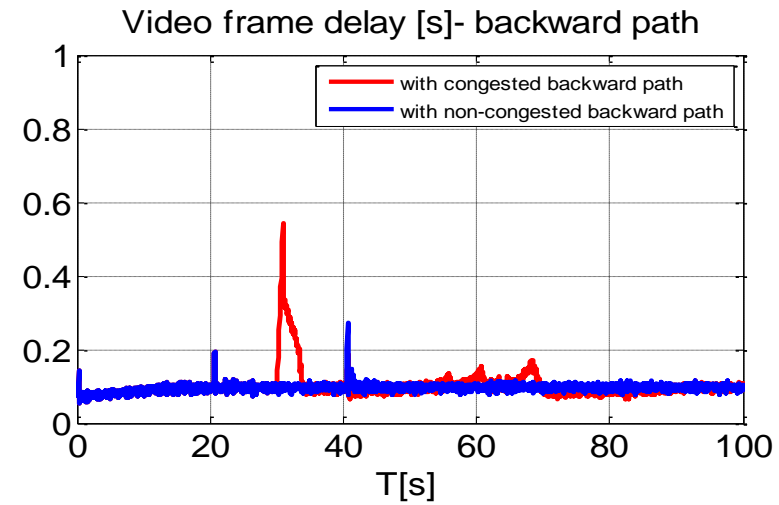

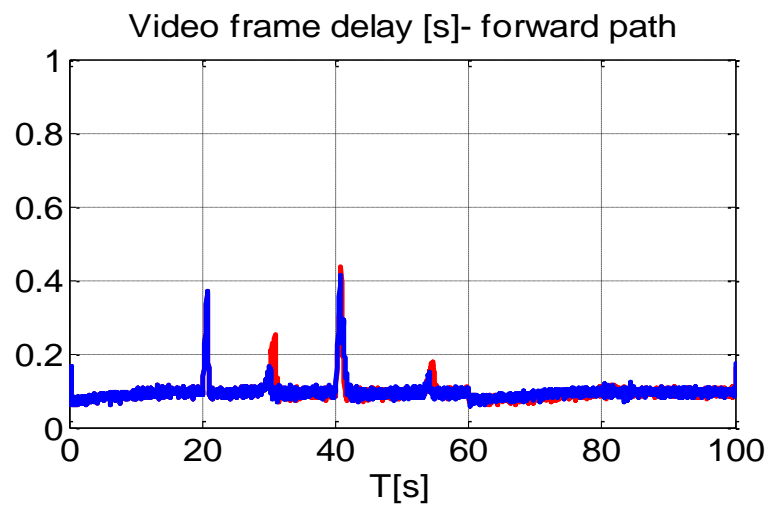

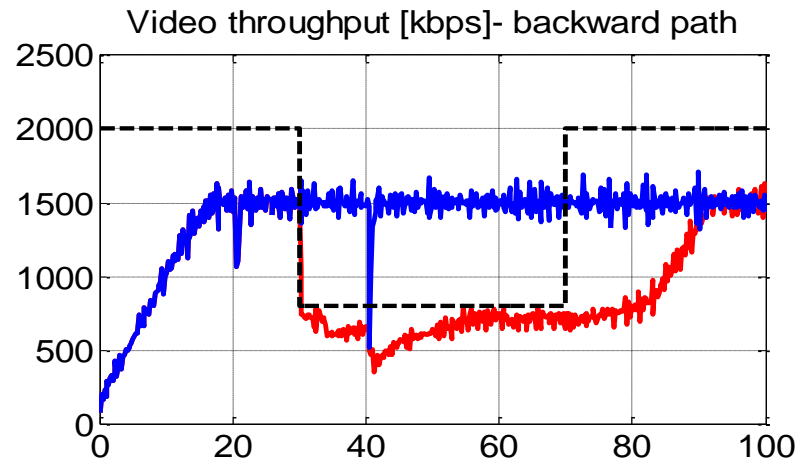

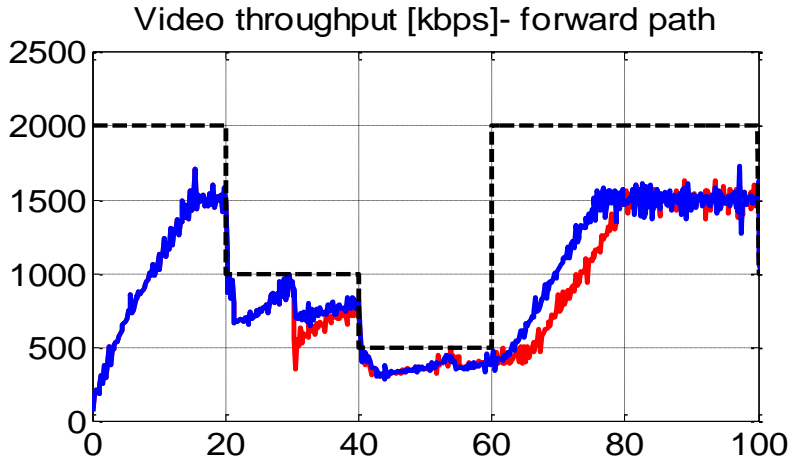

SCReAM-02

SCReAM-03

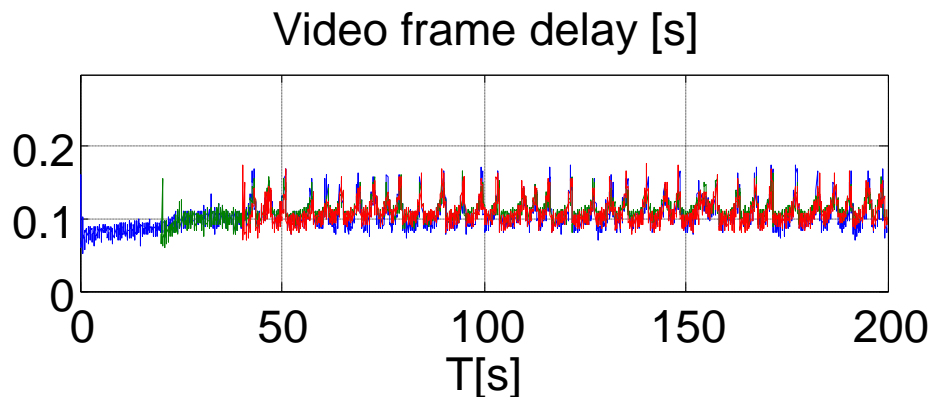

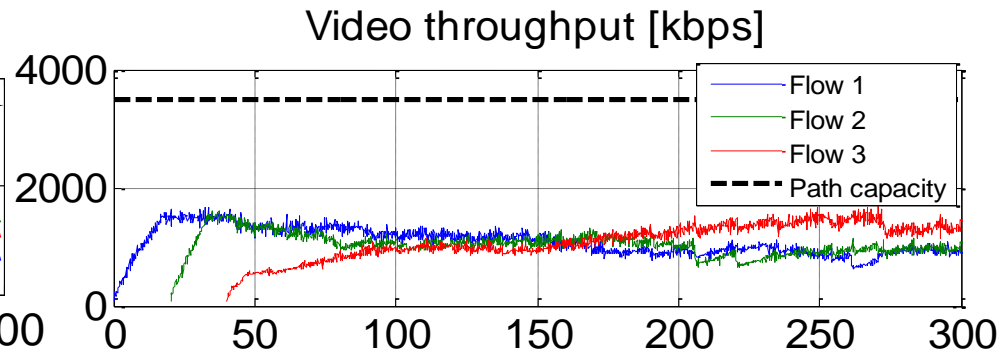

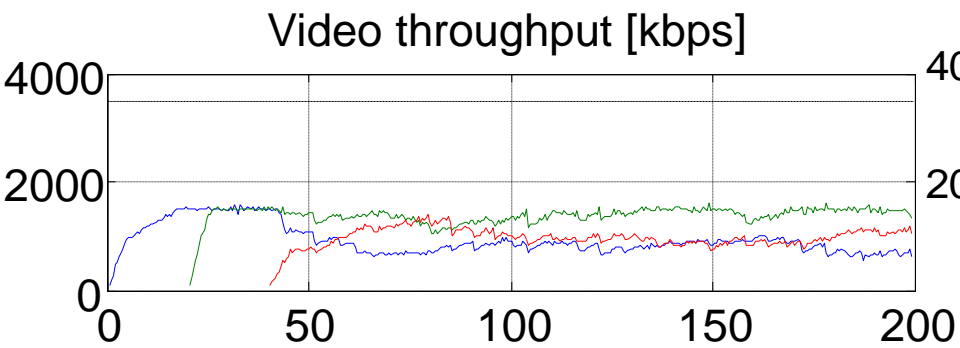

CONGESTED FEEDBACK LINK

SCReAM maximizes the bandwidth utilization on both of the paths and as expected sensitive to the delayed and lost feedback.

COMPETING RMCAT TRAFFIC

More fair with improved jitter. Jitter peaks are almost same but more sparse.

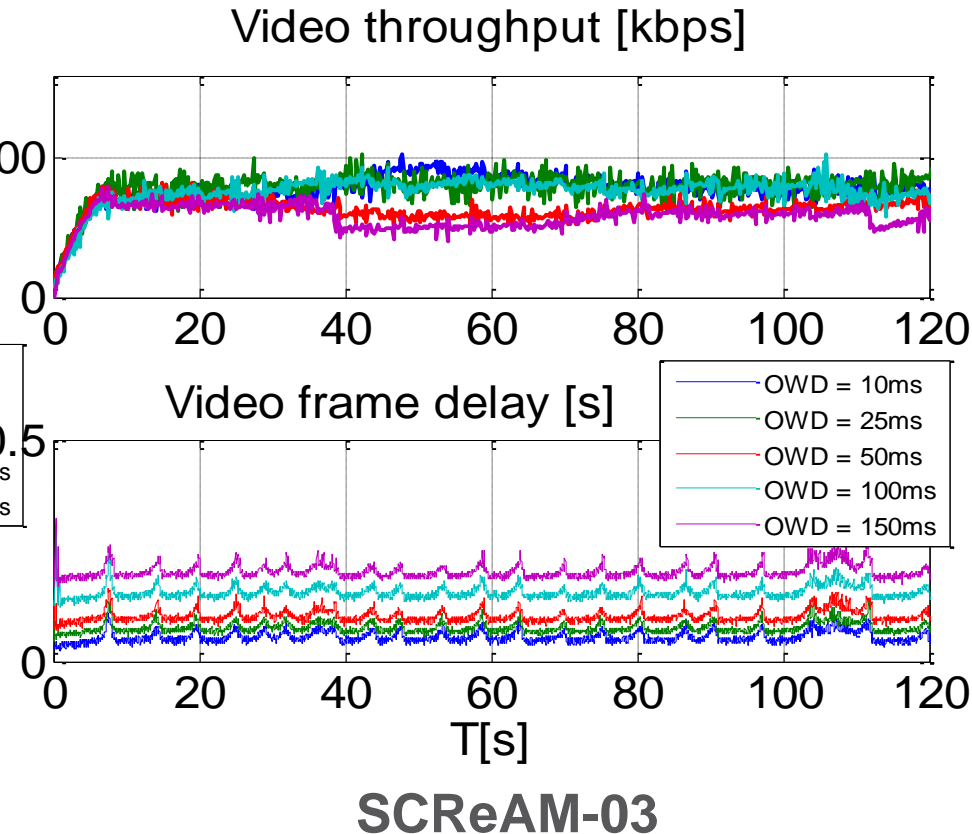

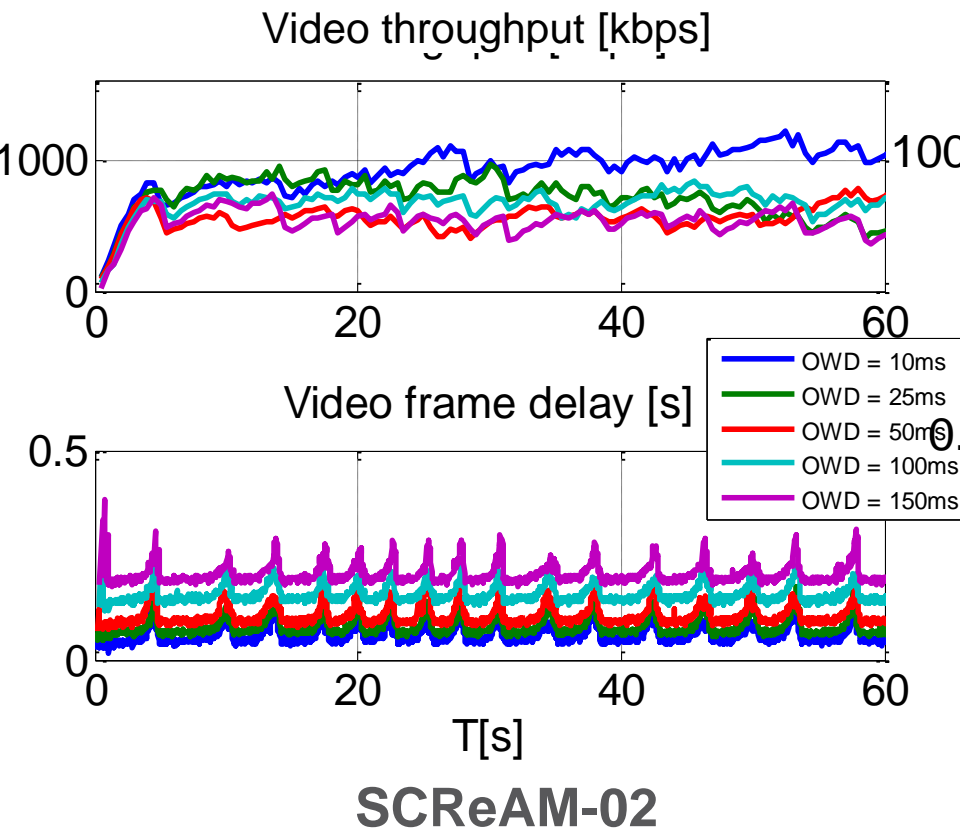

SCReAM-02

SCReAM-03

RTT FAIRNESS

More fair in terms of video throughput distribution.

COMPETING TCP TRAFFIC (DROP TAIL 300MS)

Additional delay with SReAM

- video frames are queued up as the SReAM network congestion control backs off more in response to packet loss.

Video throughput [kbps]

Video frame delay [s]

AQM packet loss rate [%]

T[s]

SReAM-02

Video throughput [kbps]

Video frame delay [s]

AQM packet loss rate [%]

T[s]

SReAM-03

COMPETING TCP TRAFFIC (DROP TAIL 300MS)

The use of frame blanking and competing flow adjustment proved to be unstable

- Needs further investigation (possibly other methods)

Video throughput [kbps]

Video frame delay [s]

AQM packet loss rate [%]

SCReAM-03

Video throughput [kbps]

Video frame delay [s]

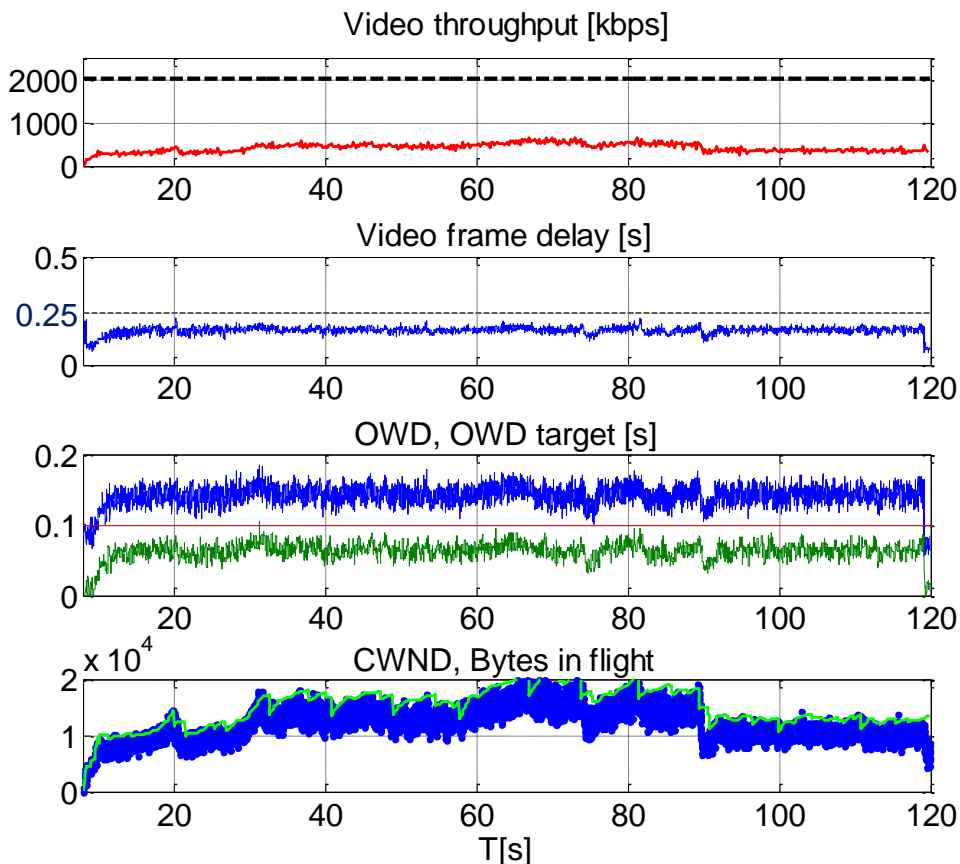

AQM packet loss rate [%]

SCReAM-03 with frame blanking
And competing flow adjustment

COMPETING LEDBAT TRAFFIC (DROP TAIL 300MS)

Hard to compete against LEDBAT with same delay target but performs relatively better if the LEDBAT delay target is lower.

LEDBAT 80ms

LEDBAT 100ms

CELLULAR TEST CASES EVALUATION

INTRODUCTION

Test cases according to draft-sarker-rmcat-cellular-eval-test-cases-01

- Downlink
 - RTT : 40ms, UE speed : 3km/h, AQM : On; FTP load 4Mbps/cell
- Uplink
 - RTT : 40ms, UE speed : 3km/h, AQM : On; FTP load 2Mbps/cell
- More results are in the extra slides section at the end

Algorithms

- 300kbps fixed bitrate
- **Self-Clocked Rate Adaptation for Multimedia (SCReAM)**
 - draft-johansson-rmcat-scream-cc-03
 - Video codec frame skipping enabled (threshold 100ms)
 - Two modes
 - **SCReAM ideal** - SCReAM with ideal video source, rate request are meet immediately.
 - **SCReAM non-ideal** - SCReAM with non-ideal video source, rate request are delayed.

METRICS

Latency (IP packet and video frame)

- Average latency
- Tail latency : 95% of all users have a e2e latency that is lower than X for 98% of the packets (or frames)

Packet loss rate

- Average Loss rate (whole session)
- 98%ile
- 90%ile

Bitrate (measured on the receiving side = goodput)

- Average bitrate (last 20 seconds of the user lifetime)
- 10% bitrate: Average bit rate for the 10% worst off users

Cell throughput

Average FTP throughput

Disclaimer

- The users/cell indications and the associated performance metrics should not be treated as exact values as there are lots of dependencies on propagation models, antenna configurations, scheduler implementations, other cross traffic involved. Therefore, the figures should be read as a comparison between congestion control algorithms under the same given network conditions.

VIDEO FRAME LATENCY

SCReAM keeps the latency low even in high load

- Even if non-ideal video source affects the performance

Uplink

Downlink

Video frame (98-95%) tail latency [s]

Video frame (98-95%) tail latency [s]

Video frame average latency [s]

Video frame average latency [s]

VIDEO FRAME LATENCY

SCReAM keeps the latency low even in high load

Uplink

98%ile latency, CDF

Downlink

BITRATE

SCReAM keeps the bitrate almost same with both modes of video sources

Uplink

Downlink

Average bitrate [kbps]

Average bitrate [kbps]

Average bitrate 10% worst off users [kbps]

Average bitrate 10% worst off users [kbps]

Coefficient of Variation

Coefficient of Variation

LOSS

SCReAM keeps the loss rate low with both mode of video sources

Uplink

Average packet loss rate [%]

98%ile packet loss rate [%]

90%ile packet loss rate [%]

Users/cell

Downlink

Average packet loss rate [%]

98%ile packet loss rate [%]

90%ile packet loss rate [%]

Users/cell

THROUGHPUT

SCReAM achieves high cell throughput with both mode of video sources

Uplink

Average cell throughput [Mbps]

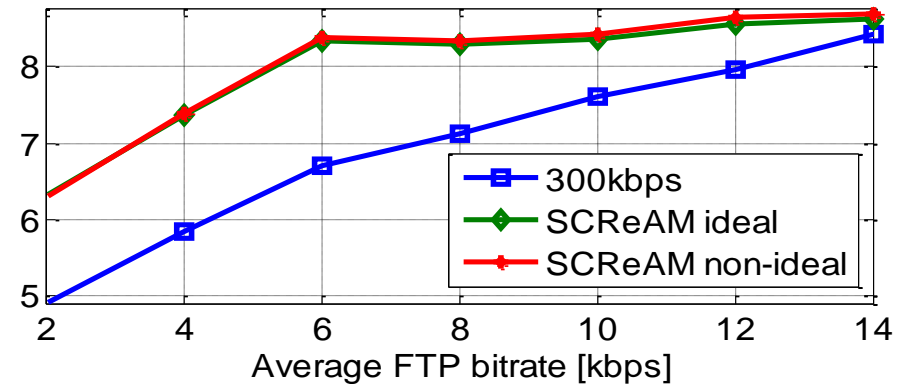

Average FTP bitrate [kbps]

Downlink

Average cell throughput [Mbps]

Average FTP bitrate [kbps]

SUMMARY

Basic test cases

SCReAM-03

Improves fairness.

Less delay spikes and jitter. Delay spikes are more sparse now.

Still needs to find a better alternative than frame blanking and current competing flow adjustment.

Cellular test cases

SCReAM-03

Non-ideal video source affects the performance a bit. Also proves that RMCAT candidate algorithms need to be tested against non-ideal video sources.

Still shows stable behavior for both non-ideal and ideal video sources.

EXTRA SLIDES

Results from selected test cases with different settings
