Abstract
This document defines three YANG data models. The first is for Segment Routing (SR) configuration and operation, which is to be augmented by different Segment Routing data planes. The next is a YANG data model that defines a collection of generic types and groupings for SR. The third module defines the configuration and operational states for the Segment Routing MPLS data plane.

Status of This Memo
This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at https://www.rfc-editor.org/info/rfc9020.

Authors' Addresses
1. Introduction

This document defines three YANG data models [RFC7950]. The first one is for Segment Routing (SR) [RFC8402] configuration and operation. This document does not define the IGP extensions to support SR, but the second module defines generic groupings to be reused by IGP extension modules. The reason for this design choice is to not require implementations to support all IGP extensions. For example, an implementation may support the IS-IS extension but not the OSPF extension. The third YANG data model defines a module that is intended to be used on network elements to configure or operate the SR MPLS data plane [RFC8660].

The YANG modules in this document conform to the Network Management Datastore Architecture (NMDA) [RFC8342].

2. Terminology and Notation

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

2.1. Tree Diagram

Tree diagrams used in this document follow the notation defined in [RFC8340].

2.2. Prefixes in Data Node Names

In this document, names of data nodes, actions, and other data model objects are often used without a prefix, as long as it is clear from the context in which YANG module each name is defined. Otherwise, names are prefixed using the standard prefix associated with the corresponding YANG module, as shown in Table 1.

Table 1: Prefixes and Corresponding YANG Modules
3. Design of the Data Model

The ietf-segment-routing YANG module augments the routing container in the ietf-routing model [RFC8349] and defines generic SR configuration and operational state. This module is augmented by modules supporting different data planes.

Module ietf-segment-routing-mpls augments ietf-segment-routing and supports SR-MPLS data plane configuration and operational state.
Module ietf-segment-routing-common defines generic types and groupings that SHOULD be reused by IGP extension modules.

          |     |       |       |       |       |       |       |       |       |     +++-ro used?      boolean
          |     |       |       |       |       |       |       |       |       |     +++-ro source-protocol -> /rt:routing
          |     |       |       |       |       |       |       |       |       |       |   /control-plane-protocols
4. Configuration

The module ietf-segment-routing-mpls augments the "/rt:routing/sr:segment-routing:" with an sr-mpls container. This container defines all the configuration parameters related to the SR MPLS data plane.

The sr-mpls configuration is split into global configuration and interface configuration.

The global configuration includes:

**Bindings**: Defines Prefix to Segment Identifier (Prefix-SID) mappings. The operator can control advertisement of Prefix-SIDs independently for IPv4 and IPv6. Two types of mappings are available:

- **Mapping-server**: Maps prefixes that are not local to a SID. Configuration of bindings does not automatically allow advertisement of those bindings. Advertisement must be controlled by each routing-protocol instance (see Section 5). Multiple mapping policies may be defined.

- **Connected prefixes**: Maps connected prefixes to a SID. Advertisement of the mapping will be done by IGP when enabled for SR (see Section 5). The SID value can be expressed as an index (default) or an absolute value. The "last-hop-behavior" configuration dictates the MPLS Penultimate Hop Popping (PHP) behavior: "explicit-null", "php", or "non-php".
Segment Routing Global Block (SRGB): Defines a list of label blocks represented by a pair of lower-bound/upper-bound labels. The SRGB is also agnostic to the control plane used. So, all local routing-protocol instances will have to advertise the same SRGB.

Segment Routing Local Block (SRLB): Defines a list of label blocks represented by a pair of lower-bound/upper-bound labels reserved for local SIDs.

5. IGP Control-Plane Configuration

Support of SR extensions for a particular IGP control plane is achieved by augmenting routing-protocol configuration with SR extensions. This augmentation SHOULD be part of the routing-protocol YANG modules as not to create any dependency for implementations to support SR extensions for all routing protocols.

This module defines groupings that SHOULD be used by IGP SR modules.

The "sr-control-plane" grouping defines the generic global configuration for the IGP.

The "enabled" leaf enables SR extensions for the routing-protocol instance.

The "bindings" container controls the routing-protocol instance's advertisement of local bindings and the processing of received bindings.

5.1. IGP Interface Configuration

The interface configuration is part of the "igp-interface" grouping and includes Adjacency SID (Adj-SID) properties.

5.1.1. Adjacency SID (Adj-SID) Properties

5.1.1.1. Bundling

In case of parallel IP links between routers, an additional Adj-SID [RFC8402] may be advertised representing more than one adjacency (i.e., a bundle of adjacencies). The "advertise-adj-group-sid" configuration controls for which group(s) an additional Adj-SID is advertised.

The "advertise-adj-group-sid" is a list of group IDs. Each group ID will identify interfaces that are bundled together.

In the figure above, R1 and R2 are interconnected by four links. A routing protocol adjacency is established on each link. The operator would like to create Adj-SIDs that represent bundles of links. We can imagine two different bundles: L1/L2 and L3/L4. To achieve this behavior, the operator will configure a "group-id" X for interfaces L1 and L2 and a "group-id" Y for interfaces...
L3 and L4. This will result in R1 advertising an additional Adj-SID for each adjacency. For example, an Adj-SID with a value of 400 will be added to L1 and L2, and an Adj-SID with a value of 500 will be added to L3 and L4. As L1/L2 and L3/L4 do not share the same “group-id”, a different SID value will be allocated.

5.1.1.2. Protection
The “advertise-protection” defines how protection for an interface is advertised. It does not control the activation or deactivation of protection. If the “single” option is used, a single Adj-SID will be advertised for the interface. If the interface is protected, the B-Flag for the Adj-SID advertisement will be set. If the “dual” option is used and if the interface is protected, two Adj-SIDs will be advertised for the interface adjacencies. One Adj-SID will always have the B-Flag set, and the other will have the B-Flag clear. This option is intended to be used in the case of traffic engineering where a path must use either protected segments or unprotected segments.

6. State Data
The operational state contains information reflecting the usage of allocated SRGB labels. It also includes a list of all global SIDs, their associated bindings, and other information, such as the associated source protocol and algorithm.

7. Notifications
The model defines the following notifications for SR.

segment-routing-srgb-collision: Raised when control-plane-advertised SRGB blocks have conflicts

segment-routing-global-sid-collision: Raised when a control-plane-advertised index is already associated with another target (in this version, the only defined targets are IPv4 and IPv6 prefixes)

segment-routing-index-out-of-range: Raised when a control-plane-advertised index falls outside the range of SRGBs configured for the network device

8. YANG Modules
There are three YANG modules included in this document.

The following RFCs are not referenced in the document text but are referenced in the ietf-segment-routing.yang, ietf-segment-routing-common.yang, and/or ietf-segment-routing-mpls.yang modules: [RFC6991], [RFC8294], [RFC8661], [RFC8665], [RFC8667], [RFC8669], and [RFC8814].

8.1. YANG Module for Segment Routing
ietf-segment-routing.yang: This module defines a generic framework for Segment Routing (SR), and it is to be augmented by models for different SR data planes.

9. Security Considerations

The YANG modules specified in this document define a schema for data that is designed to be accessed via network management protocols, such as NETCONF [RFC6241] or RESTCONF [RFC8040]. The lowest NETCONF layer is the secure transport layer, and the mandatory-to-implement secure transport is Secure Shell (SSH) [RFC6242]. The lowest RESTCONF layer is HTTPS, and the mandatory-to-implement secure transport is TLS [RFC8446].

The Network Configuration Access Control Model (NACM) [RFC8341] provides the means to restrict access for particular NETCONF or RESTCONF users to a preconfigured subset of all available NETCONF or RESTCONF protocol operations and content.
There are a number of data nodes defined in the modules that are writable/creatable/deletable (i.e., config true, which is the default). These data nodes may be considered sensitive or vulnerable in some network environments. Write operations (e.g., edit-config) to these data nodes without proper protection can have a negative effect on network operations. These are the subtrees and data nodes and their sensitivity/vulnerability:

- `/segment-routing`
- `/segment-routing/mpls`
- `/segment-routing/mpls/bindings` -- Modification to the local bindings could result in a Denial-of-Service (DoS) attack. An attacker may also try to create segment conflicts (using the same segment identifier for different purposes) to redirect traffic within the trusted domain. However, the traffic will remain within the trusted domain. Redirection could be used to route the traffic to compromised nodes within the trusted domain or to avoid certain security functions (e.g., firewall). Refer to Section 8.1 of [RFC8402] for a discussion of the SR-MPLS trusted domain.
- `/segment-routing/mpls/srgb` -- Modification of the Segment Routing Global Block (SRGB) could be used to mount a DoS attack. For example, if the SRGB size is reduced to a very small value, a lot of existing segments could no longer be installed leading to a traffic disruption.
- `/segment-routing/mpls/srlb` -- Modification of the Segment Routing Local Block (SRLB) could be used to mount a DoS attack similar to those applicable to the SRGB.

Some of the readable data nodes in these YANG modules may be considered sensitive or vulnerable in some network environments. It is thus important to control read access (e.g., via get, get-config, or notification) to these data nodes. These are the subtrees and data nodes and their sensitivity/vulnerability:

- `/segment-routing/mpls/bindings` -- Knowledge of these data nodes can be used to attack the local router with a Denial-of-Service (DoS) attack.
- `/segment-routing/mpls/sid-db` -- Knowledge of these data nodes can be used to attack the other routers in the SR domain with either a Denial-of-Service (DoS) attack or redirection traffic destined for those routers.

10. IANA Considerations

This document registers a URI in the "IETF XML Registry" [RFC3688]. Following the format in [RFC3688], the following registration is requested to be made:

ID:  yang:ietf-segment-routing-common
Registrant Contact:  The IESG.
XML:  N/A, the requested URI is an XML namespace.

ID:  yang:ietf-segment-routing
Registrant Contact:  The IESG.
XML:  N/A, the requested URI is an XML namespace.

ID:  yang:ietf-segment-routing-mpls
Registrant Contact:  The IESG.
XML:  N/A, the requested URI is an XML namespace.

This document registers YANG modules in the "YANG Module Names" registry [RFC6020].

Appendix A. Configuration Examples

Note: \line wrapping per [RFC8792].
A.1. SR-MPLS with IPv4

The following is an XML [W3C.REC-xml11-20060816] example using the SR-MPLS YANG modules with IPv4 addresses.

```xml
  <segment-routing
    <sr-mpls
      <bindings>
        <mapping-server>
          <policy>
            <name>mapping 1</name>
            <entries>
              <mapping-entry>
                <prefix>198.51.100.0/24</prefix>
                  sr-cmn:prefix-sid-algorithm-shortest-path
                </algorithm>
                <start-sid>200</start-sid>
                <range>100</range>
              </mapping-entry>
            </entries>
          </policy>
        </mapping-server>
        <connected-prefix-sid-map>
          <connected-prefix-sid>
            <prefix>192.0.2.0/24</prefix>
              sr-cmn:prefix-sid-algorithm-strict-spf
            </algorithm>
            <start-sid>100</start-sid>
            <range>1</range>
            <last-hop-behavior>php</last-hop-behavior>
          </connected-prefix-sid>
        </connected-prefix-sid-map>
      </bindings>
      <srgb>
        <srgb>
          <lower-bound>45000</lower-bound>
          <upper-bound>55000</upper-bound>
        </srgb>
      </srgb>
    </sr-mpls>
  </segment-routing>
</routing>
```
The following is the same example using JSON format.

```json
{
  "ietf-routing:routing": {
    "ietf-segment-routing:segment-routing": {
      "ietf-segment-routing-mpls:sr-mpls": {
        "bindings": {
          "mapping-server": {
            "policy": [
              {
                "name": "mapping 1",
                "entries": {
                  "mapping-entry": [
                    {
                      "prefix": "198.51.100.0/24",
                      "algorithm": "ietf-segment-routing-common:prefix-sid-algorithm-shortest-path",
                      "start-sid": 200,
                      "range": 100
                    }
                  ]
                }
              }
            }
          }
        }
      }
    }
  }
}
```

A.2. SR-MPLS with IPv6

The following is an XML [W3C.REC-xml11-20060816] example using the SR-MPLS YANG modules with IPv6 addresses.

```xml
      <bindings>
        <mapping-server>
          <policy>
            <name>mapping 1</name>
            <entries>
              <mapping-entry>
                <prefix>2001:db8:aaaa:bbbb::/64</prefix>
                <start-sid>200</start-sid>
                <range>100</range>
              </mapping-entry>
            </entries>
          </policy>
        </mapping-server>
        <connected-prefix-sid-map>
          <connected-prefix-sid>
            <prefix>2001:db8:aaaa:cccc::/64</prefix>
            <start-sid>100</start-sid>
            <range>1</range>
            <last-hop-behavior>php</last-hop-behavior>
          </connected-prefix-sid>
        </connected-prefix-sid-map>
      </bindings>
      <srgb>
        <lower-bound>45000</lower-bound>
        <upper-bound>55000</upper-bound>
      </srgb>
    </sr-mpls>
  </segment-routing>
</routing>
```
The following is the same example using JSON format.

```json
{
  "ietf-routing:routing": {
    "ietf-segment-routing:segment-routing": {
      "ietf-segment-routing-mpls:sr-mpls": {
        "bindings": {
          "mapping-server": {
            "policy": [
              {
                "name": "mapping 1",
                "entries": {
                  "mapping-entry": [
                    {
                      "prefix": "2001:db8:aaaa:bbbb::/64",
                      "algorithm": "ietf-segment-routing-common:prefix-sid-algorithm-shortest-path",
                      "start-sid": 200,
                      "range": 100
                    }
                  ]
                }
              }
            },
            "connected-prefix-sid-map": {
              "connected-prefix-sid": [
                {
                  "prefix": "2001:db8:aaaa:cccc::/64",
                  "algorithm": "ietf-segment-routing-common:prefix-sid-algorithm-strict-spf",
                  "start-sid": 100,
                  "range": 1,
                  "last-hop-behavior": "php"
                }
              ]
            }
          },
          "srgb": {
            "srgb": [
              {
                "lower-bound": 45000,
                "upper-bound": 55000
              }
            ]
          }
        }
      }
    }
  }
}
```
Acknowledgements

The authors would like to thank Derek Yeung, Greg Hankins, Hannes Gredler, Uma Chunduri, Jeffrey Zhang, Shradda Hedge, and Les Ginsberg for their contributions.

Thanks to Ladislav Lhotka and Tom Petch for their thorough reviews and helpful comments.

The authors would like to thank Benjamin Kaduk, Alvaro Retana, and Roman Danyliw for IESG review and comments.
